

IntelliMAX™ 28 V, Over-Voltage, Over-Current Protection Load Switch with Adjustable Current-Limit Control

FPF2495B

Description

The FPF2495B advanced load-management switch targets applications requiring a highly integrated solution. It disconnects loads powered from the DC power rail (<6 V) with stringent off-state current targets and high load capacitances (<100 μ F). The FPF2495B consists of a slew-rate controlled low-impedance MOSFET switch (100 m Ω maximum) and integrated analog features. The slew-rate controlled turn-on characteristic prevents inrush current and the resulting excessive voltage droop on power rails. FPF2495B has over-voltage protection and over-temperature protection.

The FPF2495B has a Reverse-Current Blocking (RCB) function that obstructs unwanted reverse current from V_{OUT} to V_{IN} during OFF states. The exceptionally low off-state current drain (<2 μ A maximum) facilitates compliance with standby power requirements. The input voltage range operates from 2.5 V to 5.5 V_{DC} to support a wide range of applications in consumer, optical, medical, storage, portable, and industrial-device power management. Switch control is managed by a logic input (active HIGH) capable of interfacing directly with low-voltage control signal / General-Purpose Input / Output (GPIO) without an external pull-down resistor.

The device is packaged in advanced, fully “green” compliant, 1.22 mm x 1.22 mm, Wafer-Level Chip-Scale Package (WLCSP).

Features

- V_{IN} : 2.5 V~5.5 V
- 28 V Absolute Ratings at V_{OUT}
- Current Capability: 2.8 A
- Adjustable Current Limit: 0.05 A ~ 2.5 A (Typ.)
 - ◆ 0.1 A~2.5 A with 10% Accuracy
 - ◆ < 0.1 A with 15% Accuracy
- R_{ON} : Typ. 70 m Ω & Max. 100 m Ω at 5 V_{IN} and 1 A I_{OUT}
- Output OVP: Min. = 5.6 V, Typ. = 5.8 V, Max. = 6 V
- No Output Discharge During Off State
- Open-Drain OCP on FLAGB
- Thermal Shutdown
- Under-Voltage Lockout (UVLO)
- Reverse-Current Blocking (RCB) during OFF
- Logic CMOS IO Meets JESD76 Standard for GPIO Interface and Related Power Supply Requirements
- ESD Protected:
 - ◆ Human Body Model: >2 kV
 - ◆ Charged Device Model: >2.5 kV
 - ◆ IEC 61000-4-2 Air Discharge: >15 kV
 - ◆ IEC 61000-4-2 Contact Discharge: >8 kV

OPERATION AND APPLICATION DESCRIPTION

Input Capacitor

To limit the voltage drop on the input supply caused by transient inrush current when the switch turns on into discharge load capacitor; a capacitor must be placed in between the V_{IN} and GND pins. A high-value capacitor on C_{IN} can be used to reduce the voltage drop in high-current applications.

Output Capacitor

An output capacitor should be placed between the V_{OUT} and GND pins. This capacitor prevents parasitic board inductance from forcing V_{OUT} below GND when the switch is on. This capacitor also prevents reverse inrush current from creating a voltage spike that could damage the device in the case of a V_{OUT} short.

Fault Reporting

Upon the detection of an over-current, OC_FLAGB signal the fault by activating LOW.

Current Limiting

The current limit ensures that the current through the switch does not exceed the maximum set value, while not limiting the minimum value. The current at which the part's limit is adjustable through the selection of the external resistor connected to the ISET pin. Information for selecting the resistor is found in the section below. The device acts as a constant-current source when the load draws more than the maximum value set by the device until thermal shutdown occurs. The device recovers if the die temperature drops below the threshold temperature.

Under-Voltage Lockout (UVLO)

The under-voltage lockout turns the switch off if the input voltage drops below the lockout threshold. With the ON pin active, the input voltage rising above the UVLO threshold releases the lockout and enables the switch.

Reverse-Current Blocking

The reverse-current blocking feature protects the input source against current flow from output to input when the load switch is off.

Thermal Shutdown

The thermal shutdown protects the die from internally or externally generated excessive temperature. During an over-temperature condition, the switch is turned off. The switch automatically turns on again if the temperature of the die drops below the threshold temperature.

Setting Current Limit

The current limit is set with an external resistor connected between the I_{SET} and GND pins. The resistor is selected

using Table 1. Resistor tolerance of 1% or less is recommended.

9530	90	100	110
20000	42	50	58

10. Table values based on 1% tolerance resistor.

11. For 50 mA setting, tolerance is $\pm 15\%$ with 1%.

If current limit is not used it is OK for the I_{SET} pin to be connected with GND, but the maximum current must be less than the maximum current capability of 2.8 A.

BOARD LAYOUT

For best performance, all traces should be as short as possible. To be most effective, the input and output capacitors should be placed close to the device to minimize the effect that parasitic trace inductance may have on normal and short-circuit operation. Using wide traces for V_{IN} , V_{OUT} , GND helps minimize parasitic electrical effects along with minimizing the case-to-ambient thermal impedance.
