

CAT3626

LED Driver, Charge Pump, 6-Channel, I²C™ Interface

Description

The CAT3626 is a high efficiency 1x/1.5x fractional charge pump with programmable dimming current in six LED channels. To ensure uniform brightness in LCD backlight applications, each LED channel delivers an accurate regulated current.

Low noise and input ripple is achieved by operating at a constant switching frequency of 1 MHz which allows the use of small external ceramic capacitors. The 1x/1.5x fractional charge pump supports a wide range of input voltages from 3 V to 5.5 V with efficiency up to 91%, and is ideal for Li-Ion battery powered devices.

The LED channels are configured into three independent pairs, each containing 2 matched channels. Each pair can be separately programmed from zero to 32 mA, in 0.5 mA resolution steps, using the I²C serial interface. Any individual channel can be disabled while others remain active. When the enable input (EN) is low, the device is in shutdown mode drawing zero current.

The device is available in a 16-pad TQFN package with a max height of 0.8 mm.

Features

- Drives 6 LED Channels
- Independent Current on 3 Pairs of LEDs
- I²C Serial Interface Programming
- Adjustable Current to 32 mA in 0.5 mA Step
- Power Efficiency up to 91%
- Fractional Pump 1x/1.5x
- Low Noise Input Ripple
- Fixed High Frequency Operation 1 MHz
- “Zero” Current Shutdown Mode
- Soft Start and Current Limiting
- Short Circuit Protection
- Thermal Shutdown Protection
- These Devices are Pb-Free, Halogen Free/BFR Free and are RoHS Compliant

Applications

- RGB LEDs
- LCD and Keypad Backlighting
- Cellular Phones, PDAs
- Digital Cameras

16	LEDA2	Cathode terminal of LED A2
	TAB	Connect to Ground on PCB

Pin Function

VIN is the supply pin for the charge pump. A small 1 μ F ceramic bypass capacitor is required between the VIN pin and ground near the device. The operating input voltage range is from 2.2 V to 5.5 V. Whenever the input supply falls below the undervoltage threshold (2 V), all LEDs channels will be automatically disabled.

EN is the enable logic input for the driver. Guaranteed levels of logic high and logic low are set at 1.3 V and 0.4 V respectively. When EN is initially taken high, the device becomes enabled and all LED currents remain at 0 mA. To place the device into zero current shutdown mode, the EN pin must be held low.

SDA is the I²C serial data line. This is a bidirectional line allowing data to be written into and read from the four registers in the driver. Registers RegA/B/C set the LED current in each pair of channels, while RegEn sets the On/Off state independently of each channel.

SCL is the I²C serial clock input.

VOUT is the charge pump output that is connected to the LED anodes. A small 1 μ F ceramic bypass capacitor is required between the VOOUT pin and ground near the device.

GND is the ground reference for the charge pump. The pin must be connected to the ground plane on the PCB.

C1+, C1- are connected to each side of the 1 μ F ceramic bucket capacitor C1.

C2+, C2- are connected to each side of the 1 μ F ceramic bucket capacitor C2.

LEDxx provide the internally regulated current to the six LED cathodes. These pins enter a high-impedance zero-current state whenever the device is placed in shutdown mode. In applications using less than six LEDs, the unused channels should be disabled through the RegEn register.

TAB is the exposed pad underneath the package. For best thermal performance, the tab should be soldered to the PCB and connected to the ground plane.

Block Diagram

Figure 25. CAT3626 Functional Block Diagram

Basic Operation

At power-up, the CAT3626 starts operating in 1x mode where the output will be approximately equal to the input supply voltage (less any internal voltage losses). If the output voltage is sufficient to regulate all LEDs currents the device remains in 1x operating mode.

If the input voltage is insufficient or falls to a level where the regulated currents cannot be maintained, the device automatically switches (after a fixed time of 400 μs) into 1.5x mode.

In 1.5x mode, the output is approximately equal to 1.5 times the input supply voltage (less any internal voltage losses).

The above sequence is repeated each and every time the chip is either powered-up or taken out of shutdown (via EN pin), or the RegEn register is accessed by write cycle.

LED Current Setting

The LED current setting is programmed via the I²C serial interface and is stored in four 8-bit registers RegA, RegB, RegC and RegEn as follows:

- RegA stores the LED current for group A (LEDA1 and LEDA2 channels),
- RegB stores the LED current for group B (LEDB1 and LEDB2 channels),
- RegC stores the LED current for group C (LEDC1 and LEDC2 channels),
- RegEn selects the on/off state of each of the 6 LED channels.

At each write access to RegEn, the driver automatically reconfigures to the mode (1x or 1.5x) that provides the highest efficiency.

Table 6. REGISTER ADDRESS AND DATA CONFIGURATION (Note 3)

Register Name	Register Address	Bit Pattern							
		Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
RegA	0	X	X	See Table 7 for values					
RegB	1	X	X						
RegC	2	X	X						
RegEn	3	X	X	LEDC2 On = 1 Off = 0	LEDC1 On = 1 Off = 0	LEDB2 On = 1 Off = 0	LEDB1 On = 1 Off = 0	LEDA2 On = 1 Off = 0	LEDA1 On = 1 Off = 0

3. X = not used, 1 = logic high, 0 = logic low

CAT3626

The Table 7 lists the various LED currents with the associated RegA, RegB, and RegC register values.

I²C Interface

The LED driver is interfaced through a 2-wire serial I²C-bus in order to control the state and the current in each of the six LED channels. The SDA and SCL lines comply with the I²C electrical specification and should be terminated with pull-up resistors. When the bus is not used, both lines are high. The device supports the maximum bus speed of 400 kbit/s. The serial bit sequence is shown below

for read and write operations into the registers. Read and write instructions are initiated by the master controller/CPU and acknowledged by the slave LED driver. The I²C address of the driver is internally fixed to the binary value 1100110. The protocol requires that the start bit and the device address are both repeated. For further details on the I²C protocol, please refer to the I²C-Bus Specification, document number 9398 393 40011, from Philips Semiconductors.

- Read operation:

S	Slave address	W	A	Register address	A	S	Slave address	R	A	Data	A*	P
---	---------------	---	---	------------------	---	---	---------------	---	---	------	----	---

- Write operation:

S	Slave address	W	A	Register address	A	Data	A	P
---	---------------	---	---	------------------	---	------	---	---

- S: Start condition
- R, W: Read bit (1), Write bit (0)
- A: Acknowledge sent by the slave LED driver (SDA high)
- A*: Not Acknowledge sent by the master microcontroller (SDA low)
- P: Stop condition
- Slave address: Device address 7 bits (MSB first, slave address is 1100110).
- Register address: Device register address 8 bits
- Data: Data to read or write 8 bits

CAT3626

Typical Application

The CAT3626 is ideal for driving RGB (red green blue) LEDs with common anode configuration. The individual LED currents associated with the red, green and blue LEDs are programmable independently through the I²C interface,

allowing to generate an accurate color mixing. Dimming while maintaining the same color can be done by reprogramming the RegEn register on and off with the appropriate duty cycle (PWM mode).
