

3.3 V/5 V Logic Gate Output Optocoupler with High Noise Immunity

FODM8071

Description

The FODM8071 is a 3.3 V/5 V high-speed logic gate output optocoupler, which supports isolated communications allowing digital signals to communicate between systems without conducting ground loops or hazardous voltages. It utilizes onsemi's patented coplanar packaging technology, OPTOPLANAR[®], and optimized IC design to achieve high-immunity, characterized by high common mode rejection specifications.

This high-speed logic gate output optocoupler, housed in a compact 5-pin Mini-Flat package, consists of a highspeed AlGaAs LED at the input coupled to a CMOS detector IC at the output. The detector IC comprises an integrated photodiode, a high-speed transimpedance amplifier and a voltage comparator with an output driver. The CMOS technology coupled with a high-efficiency LED achieves low power consumption as well as very high speed (55 ns propagation delay, 20 ns pulse width distortion).

C_{PDO}	Output Dynamic Power Dissipation Capacitance (Note 9)		-	4	-	pF

- Data rate is based on 10 MHz, 50% NRZ pattern with a 50 ns minimum bit time.
- t_{PSK} is equal to the magnitude of the worst case difference in t_{PHL} and/or t_{PLH} that will be seen between any two units from the same manufacturing date code that are operated at same case temperature ($\pm 5^{\circ}\text{C}$), at the same operating conditions, with equal loads ($R_L = 350\ \Omega$ and $C_L = 15\text{ pF}$), and with an input rise time less than 5 ns.
- Common mode transient immunity at output high is the maximum tolerable positive dV_{cm}/dt on the leading edge of the common mode impulse signal, V_{cm} , to assure that the output will remain high. Common mode transient immunity at output low is the maximum tolerable negative dV_{cm}/dt on the trailing edge of the common pulse signal, V_{cm} , to assure that the output will remain low.
- Unloaded dynamic power dissipation is calculated as follows: $C_{PD} \times V_{DD} \times f + I_{DD} + V_{PD}$ where f is switched time in MHz.

C_{ISO}	Isolation Capacitance	$V_{I-O} = 0\text{ V}$, $f = 1.0\text{ Mhz}$ (Note 10)	-	0.2	-	pF

- Device is considered a two terminal device: pins 1 and 3 are shorted together and pins 4, 5 and 6 are shorted together.
- 3,750 V_{ACRMS} for 1 minute duration is equivalent to 4,500 V_{ACRMS} for 1 second duration.
