Description

The FPF1038 advanced load−management switch target applications requiring a highly integrated solution for disconnecting loads powered from DC power rail (<6 V) with stringent shutdown current targets and high load capacitances (up to 200 μF). The FPF1038 consists of slew−rate controlled low−impedance MOSFET switch (21 mΩ typical) and other integrated analog features. The slew−rate controlled turn−on characteristic prevents inrush current and the resulting excessive voltage droop on power rails.

These devices have exceptionally low shutdown current drain (<1 μA maximum) that facilitates compliance in low standby power applications. The input voltage range operates from 1.2 V to 5.5 V DC to support a wide range of applications in consumer, optical, medical, storage, portable, and industrial device power management.

Switch control is managed by a logic input (active HIGH) capable of interfacing directly with low−voltage control signal / GPIO with no external pull−up required. The device is packaged in advanced fully “green” 1 mm x 1.5 mm Wafer−Level Chip−Scale Packaging (WLCSP); providing excellent thermal conductivity, small footprint, and low electrical resistance for wider application usage.

Features

- 1.2 V to 5.5 V Input Voltage Operating Range
- Typical R_{ON}:
  - 20 mΩ at V_{IN} = 5.5 V
  - 21 mΩ at V_{IN} = 4.5 V
  - 37 mΩ at V_{IN} = 1.8 V
  - 75 mΩ at V_{IN} = 1.2 V
- Slew Rate / Inrush Control with t_R: 2.7 ms (Typical)
- 3.5 A Maximum Continuous Current Capability
- Low <1 μA Shutdown Current
- ESD Protected: Above 8 kV HBM, 1.5 kV CDM
- GPIO / CMOS−Compatible Enable Circuitry
- This Device is Pb−Free, Halide Free and is RoHS Compliant

Applications

- HDD, Storage, and Solid−State Memory Devices
- Portable Media Devices, UMPC, Tablets, MIDs
- Wireless LAN Cards and Modules
- SLR Digital Cameras
- Portable Medical Devices
- GPS and Navigation Equipment
- Industrial Handheld and Enterprise Equipment

APPLICATION INFORMATION

Input Capacitor

This IntelliMAX™ switch doesn't require an input capacitor. To reduce device inrush current, a 0.1 μF ceramic capacitor, C_{IN}, is recommended close to the VIN pin. A higher value of C_{IN} can be used to reduce the voltage drop experienced as the switch is turned on into a large capacitive load.

Output Capacitor

While this switch works without an output capacitor: if parasitic board inductance forces V_{OUT} below GND when switching off; a 0.1 μF capacitor, C_{OUT}, should be placed between V_{OUT} and GND.

Fall Time

Device output fall time can be calculated based on RC constant of the external components as follows:

$$t_F = R_L \times C_L \times 2.2 \qquad \text{(eq. 1)}$$

where t_F is 90% to 10% fall time, R_L is output load, and C_L is output capacitor.

The same equation works for a device with a pull−down output resistor. R_L is replaced by a parallel connected pull−down and an external output resistor combination as:

$$t_F = \frac{R_L \times R_{PD}}{R_L + R_{PD}} \times C_L \times 2.2 \qquad \text{(eq. 2)}$$

where t_F is 90% to 10% fall time, R_L is output load, R_{PD} = 65 Ω is output pull−down resistor, and C_L is the output capacitor.

Resistive Output Load

If resistive output load is missing, the IntelliMAX switch without a pull−down output resistor does not discharge the output voltage. Output voltage drop depends, in that case, mainly on external device leaks.

Application Specifics

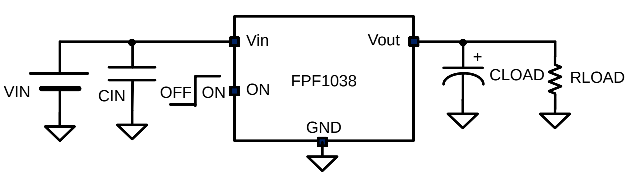

Figure 28. Device Setup

At maximum operational voltage (V_{IN} = 5.5 V), device inrush current might be higher than expected. Spike current should be taken into account if V_{IN} > 5 V and the output capacitor is much larger than the input capacitor. Input current can be calculated as:

$$I_{IN}(t) \approx \frac{V_{OUT}(t)}{R_{LOAD}} + \left(C_{LOAD} - C_{IN}\right)\frac{dV_{OUT}(t)}{dt} \qquad \text{(eq. 3)}$$

where switch and wire resistances are neglected and capacitors are assumed ideal.

Estimating $V_{OUT}(t) = V_{IN} / 10$ and using experimental formula for slew rate ($dV_{OUT}(t) / dt$), spike current can be written as:

$$\max\left(I_{IN}\right) = \frac{V_{IN}}{10R_{LOAD}} + \left(C_{LOAD} - C_{IN}\right)\left(0.05V_{IN} - 0.255\right) \qquad \text{(eq. 4)}$$

where supply voltage V_{IN} is in volts, capacitances are in micro farads, and resistance is in ohms.

Example: If V_{IN} = 5.5 V, C_{LOAD} = 100 μF, C_{IN} =10 μF, andR_{LOAD} = 50 Ω; calculate the spike current by:

$$\max\left(I_{IN}\right) = \frac{5.5}{10 \times 50} + (100 - 10)(0.05 \times 5.5 - 0.255)\ \text{A} = $$
$$= 1.8\ \text{A} \qquad \text{(eq. 5)}$$

Maximum spike current is 1.8 A, while average ramp−up current is:

$$I_{IN}(t) \approx \frac{V_{OUT}(t)}{R_{LOAD}} + \left(C_{LOAD} - C_{IN}\right)\frac{dV_{IN}(t)}{dt}$$
$$\approx 2.75 / 50 + 100 \times 0.0022 = 0.275\ \text{A} \qquad \text{(eq. 6)}$$

Recommended Layout

For best thermal performance and minimal inductance and parasitic effects, it is recommended to keep input and output traces short and capacitors as close to the device as possible. Figure 29 is a recommended layout for this device to achieve optimum performance.
