

# NCV7684

## 12 Channels 60 mA LED Linear Current Driver I<sup>2</sup>C Controllable for Automotive Applications

The NCV7684 consists of twelve linear programmable constant current sources. The part is designed for use in the regulation and control of LED for automotive applications. The NCV7684 allows 128 different current levels adjustable with pulse width modulation (PWM) programmable via I<sup>2</sup>C serial interface. The device can be used with micro-controller applications using the I<sup>2</sup>C bus or in stand-alone applications where a choice could be done in between 2 different configuration settings. The IC also provides 3.3 V voltage reference to the application for loads up to 1 mA.

LED brightness level is easily programmed using an external resistor. Each channel has an internal circuitry to detect open-load conditions with an optional auto-recovery mode. If one driver is in open-load condition, all other channels could be turned off according to the programmable bit setting.

The device is available in small body size SSOP24-EP package.

### Features

- 12 programmable Current Sources Up to 60 mA
- Common PWM Gain Control via I<sup>2</sup>C
- On-chip 125, 250, or 500 Hz PWM
- Open LED String Diagnostic
- Low Dropout Operation for Pre-Regulator Applications
- Single Resistor for Current Set Point
- Voltage Reference 3.3 V / 1 mA
- 8 bits I<sup>2</sup>C Interface with CRC8 Error Detection
- OTP Bank for Stand-Alone Operation (2 Configurations)
- Detection and Protection Against Open Load and Under-Voltage
- Over Temperature Detection and Protection
- Low Emission with Spread Spectrum Oscillator
- AEC Q100 Qualified
- SSOP24-EP Packaging
- This is a Pb-Free Device

### Applications

- Dashboard Applications
- Rear Combination Lamps (RCL)
- Daytime Running Lights (DRL)
- Fog Lights
- Center High Mounted Stop Lamps (CHMSL) Arrays
- Turn Signal and other Externally Modulated Applications

Maximum Ratings

Table 2. ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter	Min	Max	Unit
V <sub>MAX_VS</sub>	Power supply voltage: Continuous supply voltage Transient Voltage (t < 500 ms, "load dump")	-0.3	28	V
		-0.3	40	V
V <sub>MAX_INx</sub>	Input pin voltage (DIAGEN, DIAG, CONF, CSN)	-0.3	40	V
V <sub>MAX_OUTx</sub>	Continuous Output Pin voltage Transient Voltage (t < 500 ms, "load dump")	-0.3	28	V
		-0.3	40	V
V <sub>MAX_VCC</sub>	Stabilized output voltage (V <sub>CC</sub> )	-0.3	3.6	V
V <sub>MAX_VDD</sub>	Digital input supply voltage (V <sub>DD</sub> )	-0.3	5.5	V
V <sub>MAX_IO</sub>	DC voltage at pins (V <sub>DD</sub> , SCL, SDA)	-0.3	5.5	V
V <sub>MAX_ISET</sub>	DC voltage at pin ISET	-0.3	3.6	V
I <sub>MAX_GND</sub>	Maximum Ground Current	-	750	mA
T <sub>JMAX</sub>	Junction Temperature, T <sub>J</sub>	-40	150	°C

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. Integrated protection functions are designed to prevent IC destruction under fault conditions described in the datasheet. Fault conditions are considered as outside normal operating range. Protection functions are not designed for continuous repetitive operation.

ESD Protection and Packaging

Table 3. EDS PROTECTION (Note 1)

Parameter	Value	Unit
ESD Voltage, HBM (Human Body Model); (100 $\mu$ F, 1500 $\Omega$ ) All Pins Output Pins OUTx to GND	$\pm 2$ $\pm 4$	kV

**General**

The NCV7684 is a twelve channel LED driver. Each output can drive currents up to 60 mA/channel and are programmable via an external resistor. The target applications for the device are in automotive rear lighting systems and dashboard applications. The device can be used with micro-controller applications using the I<sup>2</sup>C bus or in stand-alone applications. In both cases it is mandatory to supply the LED channels by an external ballast transistor, or by an LDO or a DC/DC. In order to have very low electromagnetic emission, this device has an embedded spread spectrum oscillator.

Example:

R1 = 2 kΩ  
 using eq. 2 → I<sub>SET</sub> = 500 μA  
 and using eq. 3 → I<sub>OUTx</sub> = 50 mA

To avoid potential disturbances when all drivers are activated at the same time, a typical activation delay of 400 ns between groups of 2 consecutive outputs is implemented (see Figure 5).

**Output Current Programming (I<sub>SET</sub>/OUTx)**

The maximum current can be defined with the Iset input pin. The equations below can be used to calculate this maximum output current:

$$I_{set} = 1 \text{ V}/R1 \quad (\text{eq. 2})$$

$$I_{OUTx} = K \times I_{set} \quad (\text{eq. 3})$$

Figure 5.

**Power Supply and Voltage Reference (VS, V<sub>CC</sub>, V<sub>DD</sub>)**

VS is the analog power supply input of the device. VS supply is monitored with respect to the crossing of VSUV level (typ. 4.1 V). When VS rises above VSUV, the device starts the power-up state. When VS is above the VS\_OP minimum level (typ. 5 V), the device can work properly.

V<sub>CC</sub> is a voltage reference providing 3.3 V derived from the VS main supply. It is able to deliver up to 1 mA and is primarily intended to supply 3.3 V loads.

V<sub>DD</sub> is the digital power supply input of the device.

**Ground Connections (GND: Pin 13 and Pin 19)**

The device ground connection is split to two pins called GND. Both pins have to be connected on the application PCB.

**Chip Select (CSN)**

The device can be programmable using the I<sup>2</sup>C bus in End Of Line cases. When the CSN pin has a voltage above 1.66 V, the device will be set in zapping control mode via the I<sup>2</sup>C

bus. When CSN will be connected to ground or below 0.7 V, the device will be in a mode where zapping is not possible. Zapping is only possible with VS above 13 V.

**Configuration (CONF)**

When the CONF input voltage will be below 0.7 V the configuration 1 will be selected (One Time Programmable OTP 1 register called SAM\_CONF\_1) and when the CONF input voltage will be above 1.66 V the configuration 2 will be selected (OTP 2 register called SAM\_CONF\_2). There is ability to change the configuration in error mode (either with CONF in SAM or through I<sup>2</sup>C in I2C mode).

**I<sup>2</sup>C Bus (SCL, SDA)**

The I<sup>2</sup>C bus consists of two wires, Serial Data (SDA) and Serial Clock (SCL), carrying information between the devices connected on the bus. Each device connected to the bus is recognized by a unique address and operates as either a transmitter or receiver, depending on the function of the device. The NCV7684 can both receive and transmit data

## NCV7684

with CRC8 error detection algorithm. The NCV7684 is a slave device.

SDA is a bi-directional line connected to a positive supply voltage via an external pull-up resistor. When the bus is free both lines are HIGH. The output stages of the devices connected to the bus must have an open drain to perform the wired-AND function. Data on the I<sup>2</sup>C bus can be transferred up to 400 kb/s.

### Diagnostic Enabling (DIAGEN)

The device is capable to detect for each independent channel an open load condition. Versus the number of LEDs and the V<sub>STRING</sub> voltage supply, a wrong open load condition can be detected if the fault detection is activated when there is not enough voltage across the LEDs. This threshold can be programmable thanks to an external divider connected to the DIAGEN pin. When the divided voltage is below a typical value of 2 V, the LED diagnostic is disabled. When the divided voltage is above the typical value of 2 V, the LED diagnostic is enabled.

### Diagnostic Feedback (DIAG)

The DIAG is an open drain output pin who can alert a microcontroller as soon as one of the outputs is in error mode (DIAG Low = open load or thermal shut-down or Iset shorted). Forcing the DIAG pin below 1.8 V will force a fault condition if the DIAGEN input pin is above a typical value of 2 V. If the DIAGEN input pin is below the typical value of 2 V then forcing the DIAG input pin will not have any effect.

### Parallel Outputs (OUTx)

The maximum rating per output is 60 mA. In order to increase system level LED string current, parallel combinations of any number of outputs is allowed. Combining all 12 outputs will allow for a maximum system level string current design of 720 mA.

**DIGITAL PART AND I<sup>2</sup>C REGISTERS**

The I<sup>2</sup>C bus consists of two wires, serial data (SDA) and serial clock (SCL), carrying information between the devices connected on the bus. Each device connected to the bus is recognized by a unique address. The NCV7684 can both receive and transmit data with CRC8 error detection

algorithm. The NCV7684 is a slave device only. Generation of the signals on the I<sup>2</sup>C bus is always the responsibility of the master device.

They are multiple kinds of message structure possible versus ID code received.

**Table 7. IDENTIFIER ADDRESSING (ID) MESSAGE**

Name	ID	Access type	Name of Register Addressed
ID_I2C_CONF	00	W	I2C_CONF
ID_PWM	01	W	PWM_GAIN, PWM_GAIN_EN
ID_WRITEALL	02	W	I2C_CONF, PWM_GAIN, PWM_GAIN_EN
ID_PWM_CONF	03	W	PWM_CONF
ID_STATUS	08	R	I2C_STATUS
ID_FAULT	09	R	FAULT_STATUS
ID_READALL	0A	R	I2C_CH_STATUS, I2C_STATUS, FAULT_STATUS
ID_SET_OTP	20	W	SAM_CONF_1, SAM_CONF_2, ADD_SAM_SET

ID_READ_OTP	28	R	ID_VERS_1, ID_VERS_2, SAM_CONF_1, SAM_CONF_2, ADD_SAM_SET

There are 3 kinds of registers, Hard Coding, OTP and volatile registers.

Hard Coding Registers:

- ID\_VERS\_1
- ID\_VERS\_2

OTP Registers:

- ADD\_SAM\_SET
- SAM\_CONF\_1
- SAM\_CONF\_2

Volatile Registers:

- I2C\_CONF
- I2C\_STATUS
- I2C\_CH\_STATUS
- FAULT\_STATUS
- PWM\_GAIN
- PWM\_GAIN\_EN
- PWM\_CONF

## NCV7684

There is a safety mechanism implemented by repeating the address. Since the I<sup>2</sup>C address is 7 bits long, first bit of the second address byte starts with a “0” in the repeated byte (see tables below).

**Table 8.**

1 <sup>st</sup> Byte							
7	6	5	4	3	2	1	0
I <sup>2</sup> C Device Address							R/W Bit
2 <sup>nd</sup> Byte							
7	6	5	4	3	2	1	0
I <sup>2</sup> C Device Address							0

### HARD CODING REGISTERS

**Table 9. HARD CODING REGISTERS**

Bit	D7	D6	D5	D4	D3	D2	D1	D0
<b>ID_VERS_1</b>								
Bit name	ID1[7:0]							
Access type	R	R	R	R	R	R	R	R
Reset value	0	1	0	0	0	0	1	1
<b>ID_VERS_2</b>								
Bit name	ID2[7:0]							
Access type	R	R	R	R	R	R	R	R
Reset value	0	0	0	0	0	0	1	0

1. ID1[7:0] = 43h (ON Semi Device Identifier)  
ID2[7:0] = 02h (The Actual Version)

OTP REGISTERS

Table 10. ADD\_SAM\_SET

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Bit name	AUTOR	DETONLY	ERREN	ADD[4:0]				
Access type	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset value	0	1	0	0	0	0	0	0

ADD[4:0] are the programmable BUS address registers (in I2C mode ADD[6:5] = 11).

**AUTOR:** When AUTOR = 1 (and DIAGEN is high), open load diagnosis is performed. When a fault is detected, the DIAG pin is set and LED driver imposes a low current on the faulty branch alone, switching off the others. When fault is recovered, LED driver returns to normal operation after resetting the DIAG pin. If the DIAG pin is triggered externally, LED driver outputs are switched off and the low power mode is entered.

**DETONLY:** When DETONLY = 1, open load diagnostic is performed. When a fault is detected, the DIAG pin is set without taking any action on the current regulation. When fault is recovered, DIAG is reset. If the DIAG pin is triggered externally, no action is taken.

When AUTOR = DETONLY = 0, no diagnostic performed  
 When AUTOR = DETONLY = 1, no change (same as previously setting).

**ERREN:** When ERREN = 1, CRC error detection algorithm is activated for I<sup>2</sup>C communication.

Table 11. SAM\_CONF

Bit	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0

- SAM1conf[x] = 0 means channel is OFF and SAM1conf[x] = 1 means channel is ON  
 SAM2conf[x] = 0 means channel is OFF and SAM2conf[x] = 1 means channel is ON

VOLATILE REGISTERS

Table 12. I2C\_CONF

Bit	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
Bit name	I2CFLAG	I2CautoR	I2CdOnly	PWMEN	I2Cconf[11:0]											
Access type	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W
Reset value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**I2CFLAG:** the I2CFLAG should be reset whenever standalone mode is entered. When I2CFLAG = 1 and when V<sub>DD</sub> is high, the I2C mode is activated, in all other conditions the device is in Stand Alone Mode.

**I2CautoR:** When I2CautoR = 1 (and DIAGEN is high), open load diagnosis is performed. When a fault is detected, the DIAG pin is set and LED driver imposes a low current on the faulty branch alone, switching off the others. When fault is recovered, LED driver returns to normal operation after resetting the DIAG pin. If the DIAG pin is triggered externally, LED driver outputs are switched off and the low power mode is entered.

**I2CdOnly:** When I2CdOnly = 1, open load diagnostic is performed. When a fault is detected, the DIAG pin is set

without taking any action on the current regulation. When fault is recovered, DIAG is reset. If the DIAG pin is triggered externally, no action is taken.

When I2CautoR = I2CdOnly = 0, no diagnostic performed.

When I2CautoR = I2CdOnly = 1, no change (same as previously setting).

**PWMEN:** When PWMEN = 1, PWM is activated, when PWMEN = 0 the content of the complete register PWM\_GAIN\_EN is not reset and PWM is disabled.

I2Cconf[x] = 0 means channel is OFF and I2Cconf[x] = 1 means channel is ON.

Table 13. I2C STATUS

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Bit name	SC_Iset	I2Cerr	UV	diagRange	TW	TSD	DIAGERR	OL
Access type	R	R	R	R	R	R	R	R
Reset value	0	0	0	0	0	0	0	0

**SC\_Iset:** SC\_Iset = 1 means there is short-circuit on the external resistor on Iset pin and drivers are switched OFF and DIAG pin is set. SC\_Iset = 0 no short-circuit.

**I2Cerr:** I2Cerr = 1 means an error has been detected during the I2C communication, I2Cerr = 0 means no error during I2C communication has been detected.

**UV:** the device is in under voltage condition (VS is below VSUV threshold, all channels OFF).

**diagRange:** when diagRange = 1 the divided voltage is above the typical value of 2 V (LED diagnostic is enabled), diagRange = 0 means the divided voltage is below the typical value of 2 V (LED diagnostic is disabled).

**TW:** when TW=1 the device is in the thermal warning range (typ. 140°C), this flag is just a warning no action is foreseen on the output drivers. TW = 0 means the device is below the thermal warning range.

**TSD:** when TSD = 1 the device is in the Thermal shutdown range, TSD = 0 means the device is below the thermal shutdown range.

**DIAGERR:** DIAGERR = 1 means an error is detected by DIAG pin forced externally.

**OL:** OL = 1 means at least one channel is in Open Load condition, OL = 0 no Open Load.

Table 14.

SC_ISET	Set when a short-circuit on the external resistor on Iset pin, latched if permanent after 10 μs. Reset in case of short-circuit disappear permanently for at least 10 μs
I2CERR	Set if an error has been detected during the I2C communication. Reset on register reading
UV	Set when device is in under voltage condition (VS is low, all channels OFF)
diagRange	Set when divided voltage is above the V <sub>DIAGEN</sub> TH threshold. Reset when the divided voltage is below the V <sub>DIAGEN</sub> TH threshold
TW	Set when junction temperature is above the T <sub>JWAR_ON</sub> threshold. Reset on register reading and if temperature is below the (T <sub>JWAR_ON</sub> - T <sub>JSD_HYS</sub> ) threshold
TSD	Set when junction temperature is above the TSD threshold. Reset on register reading and if temperature is below the TSD - T <sub>JSD_HYS</sub> threshold

**Table 14.** (continued)

DIAGERR	Set by DIAG pin forced low externally, latched if permanent after 10 $\mu$ s. Reset in case DIAG pin is not forced permanently for at least 10 $\mu$ s
OL	Set in Open Load condition and DIAGEN is high, latched if permanent after 10 $\mu$ s. Reset if Open Load disappear permanently for at least 10 $\mu$ s. Fault information is maintained on falling DIAGEN threshold exceeded

**Table 15. I2C\_CH\_STATUS**

Bit	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
Bit name	I2CFLAG	I2CautoR	I2CdOnly	PWMEN	I2C_CH_STATUS[11:0]											
Access type	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Reset value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

*I2CFLAG*: same as I2C\_CONF register.

*I2CautoR*: same as I2C\_CONF register.

*I2CdOnly*: same as I2C\_CONF register.

*PWMEN*: same as I2C\_CONF register.

*I2C\_CH\_STATUS[11:0]*: same as I2C\_CONF[11:0] bits in I2C mode or same as SAM\_CONF\_1[11:0], SAM\_CONF\_2[11:0] bits in Standalone mode.

*Remark*: When NCV7684 is configured in I2C mode and output channel OUTx is configured to operate in PWM mode, I2C\_CH\_STATUS[x] shall contain value ‘1’.

**Table 16. FAULT\_STATUS**

Bit	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
Bit name	-	-	-	-	FAULT[11:0]											
Access type	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Reset value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

*FAULT[11:0]*: when FAULT[x] = 1 the OUTx channel is in fault mode (Open Load latched when the duration is longer than 10  $\mu$ s), when FAULT[x] = 0 the OUTx channel

is working properly. The register is reset on each read operation.

**Table 17. PWM\_GAIN**

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Bit Name	PWMF1	PWMGAIN[6:0]						
Access type	W	W	W	W	W	W	W	W
Reset Value	0	0	0	0	0	0	0	0

*PWMGAIN[6:0]*: logarithmic (or linear) dimming via embedded PWM generator (128 steps). Following formula applies when logarithmic dimming is selected:  
 $Duty\_Cycle\_Percent = 100 \times \alpha^{(N-i)}$  where  $\alpha = 0.9471$ ,  
 $N = 127$  and  $i = PWMGAIN[6:0]$  rounded with an accuracy of 400 ns.

*PWMF1*: when PWMF1 = 1, PWM dimming is done at a typical frequency of 250 Hz, when PWMF1 = 0 means PWM dimming is done at a typical frequency of 125 Hz (when PWMF2 = 0).

**Table 18. PWM\_GAIN\_EN**

Bit	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
Bit name	-	-	-	-	PWMGAINen[11:0]											
Access type	-	-	-	-	W	W	W	W	W	W	W	W	W	W	W	W
Reset value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

*PWMGAINen[11 :0]* : when  $PWMGAINen[x] = 1$ , PWM dimming is enabled for  $OUTx$  channel, when  $PWMGAINen[x] = 0$  means PWM dimming is disabled for  $OUTx$  channel.

**Table 19. PWM\_CONF**

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Bit name	-	-	-	-	-	-	PWMLIN	PWMF2
Access type	W	W	W	W	W	W	W	W
Reset value	0	0	0	0	0	0	0	0

*PWMLIN* bit shall select between logarithmic ( $PWMLIN = 0$ ) and linear ( $PWMLIN = 1$ ) translation of *PWMGAIN* bits to duty cycle of internal PWM signal.

*PWMF2*: when  $PWMF2 = 1$ , PWM dimming is done at a typical frequency of 500 Hz, when  $PWMF2 = 0$ , *PWMF1* setting applies.
