NCV74300V1GEVB

NCV7430 LIN RGB LED Driver Evaluation Board User’s Manual

Introduction

The NCV74300V1GEVB is an evaluation board for single-chip RGB driver NCV7430, intended for dedicated multicolor LED applications. The RGB LED driver contains a LIN interface (slave) for parametric programming of LED color and intensity.

The device receives instructions through the LIN bus and subsequently drives the LEDs independently.

The NCV7430 acts as a slave on the LIN bus and the master can request specific status information (parameter values and error flags). The LIN address of the NCV7430 can be programmed in the internal memory of the device.

The design incorporates the lowest bill of materials, minimized board size and allows easy interconnection in case of multiple nodes network.

Features

• Small Size of PCB
• Two Parallelized Connectors for Easy Daisy-chain Connection

Applications

• Automotive Interior Lighting

## ABSOLUTE MAXIMUM RATINGS AND OPERATING RANGES

### Table 1. ABSOLUTE MAXIMUM RATINGS

(The operation of the NCV7430 evaluation board works with the custom made ON Semiconductor LIN Interface in combination with the custom GUI interface. No additional power supply is needed other than the supplied 12 V AC/DC adapter which powers the LIN Interface through DC Power Input connector.)

</tbody>
</table>

1. Both connectors pinout is identical.
2. Connectors J1 and J2 are connected in parallel. Typically, J1 is a supply input while J2 is a supply output, which supplies the next board in the serial chain.
This section contains instructions for the NCV7430 setup configuration and first connection. Only a few steps need be proceeded to get fully working simple LIN RGB LED network.

Please take the following steps to get a functional setup:

1. Install the NCV7430 Evaluation Software (see the NCV7430 Evaluation Software section for details). The USB drivers are included in the installation package. This installation requires administrator rights.

2. Connect LIN Interface to USB and wait until the device is installed. This step requires administrator rights.

3. Connect the boards according to figure below. Initially all the nodes have address set to default value 0. In case the node addresses haven’t been set previously, connect only one node to USB−LIN interface to avoid having two nodes with same address connected to the network.

![Diagram of NCV7430 Evaluation Setup Connection (Configuration 1)](image1)

![Diagram of NCV7430 Evaluation Setup Connection (Configuration 2)](image2)
4. Run the NCV7430 Evaluation Software.

5. Select one of the nodes from “Nodes” table (detected nodes are highlighted in yellow).

6. To switch the LED to On state set the parameters in Set Color group box according to picture below and select Transmit. The color setting can be freely modified. Then set the parameters in Set LED Control group box and select Transmit. These two commands can be sent in any order.

7. LED should be turned on with preset color.

NCV7430 EVALUATION SOFTWARE

Minimum Requirements

Operating system
- Windows XP, SP3 (32/64-bit)
- Windows Vista, SP1 (32/64-bit)
- Windows 7 (32/64-bit)
- Microsoft .NET Framework 4.0

Hardware requirements
- Processor: 1 GHz
- RAM: 512 MB
- Disk Space: 850 MB (32-bit system)
  2 GB (64-bit system)

- Monitor resolution: minimum 800x600 pixels
- USB port

(The minimum disk space requirement is based on Microsoft .NET Framework 4.0 system requirements)

Installation Procedure

1. Please check if Microsoft .NET Framework 4.0 is installed on your computer. If not, run dotNetFx40_Full_setup.exe prior to the NCV7430 Evaluation software installation.
2. Run NCV7430 Evaluation Setup.exe and follow the installation wizard instructions.
**Driver Setup**

USB drivers should be installed automatically with the software. Once installed, you can plug the LIN Interface into the USB port. The hardware should be installed automatically and following message should be displayed:

![Found New Hardware]

The installation can be checked in Device Manager. When the hardware is connected, you should be able to find **USB Serial Converter A and B** in **Universal Serial Bus controllers** group.

In case you encounter any problem with the drivers, try installing the drivers manually. The drivers can be found on [http://www.ftdichip.com/Drivers/D2XX.htm](http://www.ftdichip.com/Drivers/D2XX.htm) – D2XX drivers – also available as executable file.

---

**NCV7430 SOFTWARE OVERVIEW**

NCV7430 Evaluation is a graphical user interface (GUI) for NCV7430 RGB LED driver. The software provides several screens organized in tab layout.

- Main
- Network Configuration
- Node Configuration
- Node Calibration
- LIN Commands
- User Script Language (USL)

**Main Tab**

Main tab provides following frames:

<table>
<thead>
<tr>
<th>Writing Frame</th>
<th>Reading Frame</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set_Color</td>
<td>Get_Full_Status</td>
</tr>
<tr>
<td>Set_LED_Control</td>
<td>Get_Status</td>
</tr>
<tr>
<td>Get_Full_Status</td>
<td>Get_LED_Control</td>
</tr>
<tr>
<td>Get_Status</td>
<td>Get_Color</td>
</tr>
<tr>
<td>Get_LED_Control</td>
<td>Get_Actual_Param1</td>
</tr>
<tr>
<td>Get_Color</td>
<td>Get_Actual_Param2</td>
</tr>
</tbody>
</table>

![NCV7430 Evaluation 3.0](image)

*Figure 7. NCV7430 Evaluation – Main Tab*
The first step is to select the node, then configure respective frame and click Transmit, or Send Request.

**Selecting the Node**

The node you want to use can be selected by clicking on its node address (ADx) in the nodes table. You can also select one of the 16 groups instead of specific node. Only writing frames can be sent to a Group. All the reading frames need to be sent to one specific node.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

**Enabling the LEDs**

The LEDs can be enabled by sending Set_LED_Control command with LEDs Enabled and all the individual LED1, LED2 and LED3 set to On.

When LEDs Enable is set to On, the individual LED’s can be enabled and disabled independently by setting LED1 – LED3 to On/Off. LED Enable status can be checked by sending Get_Full_Status frame. Please note that even with LED correctly enabled, you can see no output light in case the LED modulation registers are set to 0.

**Setting the Color**

LED output color can be set either by Set_Color or Set_Color_Short command.

Once the LED’s are enabled, in Set Color Group box:
1. Select Set Color command. (see Figure 10)
2. Set LED’s Enable to On.
3. Select any color by setting LED1, LED2 and LED3 modulation values.
4. Select any Intensity.
5. Click on Transmit button.

or
1. Select Set Color Short command. (see Figure 11)
2. Select any color by setting LED1, LED2 and LED3 modulation values.
3. Click on Transmit button.

The required color can be also chosen in a Color dialog (see Figure 12). To open the CIE Color Diagram click on the colored “Set color…” field in Set Color group box.
NOTE: With selecting “Online set color”, the LED module follows the color chosen in the diagram.

**Figure 12. Color Dialog**

*Setting the Intensity*

The overall intensity of the LEDs is programmable with a four bit scaling factor that is applied over the LED modulation. The scaling is linear (factor \( n/16 \), \( n = 15 \) is mapped to 1.0). LED intensity can be set either by Set_Color or Set_Intensity command.

In Set Color Group box:
1. Select Set Color Command or Set intensity command.
2. Set Intensity level.
3. Click to Transmit.

*Theatre Dimming Function*

The NCV7430 has a fading function to give a theater dimming effect when changing color and/or intensity settings. The effect presents itself as a smooth transition between colors, or increases or decreases in intensity.

The fading effect can be enabled by setting Set_Color command (see Figure 13):

In Set Color Group box:
1. Set Fading to On.
2. Select any Fading Time.
3. Choose Linear or Logarithmic fading.
4. Click on Transmit.
5. With enabled fading function, Change Color or intensity.

**Figure 13. Set_Color Command**
The fading time can be also set by Set_intensity command (see Figure 14).

LED Modulation Frequency

The LED modulation frequency can be chosen to be 122 Hz or 244 Hz.

In Set LED Control Group box
1. Select 122 Hz or 244 Hz PWM Frequency and Click Transmit.
2. The PWM frequency can be measured by oscilloscope on LEDxC or LEDxR pin.

LED Update Modes

The Set_Color Command can be sent in following update modes:
- Immediate Update
- Store and Do Not Update
- Update to the Already Stored Values
- Discard

When “Immediate update” mode is selected, the changes are applied right after the Set_Color command is sent.
In “Store and do not update” mode, the values selected in Set Color Group box are stored in internal memory and are applied only when the Set_Color Command is sent in “Update to the already stored values” mode.

Sleep Mode and Wakeup

In sleep mode, LEDs are turned OFF and the VBIAS output is brought to 0 V, turning OFF the optional bypass transistor. The internal circuitry of the NCV7430, including the band gap reference, internal oscillator and current sources are put in low power mode and the internal registers are reset. In Sleep mode the total battery current consumption is reduced.

To bring the NCV7430 to the Sleep mode, select Sleep in the Sleep/Wakeup Group box and click Transmit.

Network Configuration Tab

This screen provides network scanning function and Groups configuration.

Scan Network

Whenever new node is connected to the network, the network scan should be perform in order to detect all the available node addresses.

Use the Scan Network button to perform the network scan. It can take few seconds to complete this action. Once completed, all the detected nodes are listed in the Nodes table.

Groups Configuration – Group Address

Each node can be added to one specific Group. Choose the desired group with right mouse button click, select Add nodes menu and select the node you want to add to this group or simply select one of the nodes and then click the new group. The changes are not applied immediately, but will appear in the List of Changes on the right side. User can cancel any prepared change by clicking with right mouse button in the List of changes table and selecting Cancel Change. Once all the needed changes are prepared, click on the Apply changes button to program the Group Address OTP’s.

In the Figure 17, three nodes are attached to the network. AD0 and AD2 belongs to Group0 and AD3 belongs to Group3.

To add Node AD2 to Group 5:
1. Select Node AD2.
2. Click the Group 5.
3. The modification will appear in the List of changes.
4. Click the Apply changes button to write the new setting to the device.

Figure 14. Set_Intensity Command

Figure 15. LED Modulation Frequency

Figure 16. Sleep/Wakeup Mode

The NCV7430 wakes up from sleep after detection of a transition of LIN recessive state to dominant state followed by a dominant level for a time period of $t_{\text{wake}}$ and again a rising edge from dominant to recessive. Select Wake-up in the Sleep/Wakeup Group box and click Transmit. As internal register are reset after entering Sleep mode, the LED’s are not enabled after Wake-up. Set_Color and Set_LED_Control frames are required after Wakeup to set LED’s on again.
Node Configuration Tab

OTP’s Programming

All OTP's except Group Address can be zapped from Node Configuration Tab. Group Address OTP can be zapped from Network Configuration tab.

Node Address (NAD)

Node Address can be set by Node Address Programming command on Node Configuration (see Figure 18).

To change the node default address:
1. Select appropriate node from the list.
2. Select the new NAD address in “Node address programming” Groupbox. The valid addresses are marked in green. (New address AD4 selected to be programmed to Node AD0 in the picture below)
3. Click Program New Address.

After programming, the network is automatically updated.

Node Address programming can be repeated while LockBit1 is not zapped. Each bit can be programmed only once (programming means setting from 1 to 0). E.g. it is possible to change address from 1 to 3 but not to 2.

Group Address

Group Address can be configured in Network Configuration Tab.

Node Calibration Tab

This part can be used to calculate the reference matrix and calibration factors and to write these factors to OTP shadow registers (see Figure 19).

1. Measure LED’s.
2. Find the smallest triangle.
3. Calculate calibration factors.
4. Select node for calibration.
5. Set Calibration factors according to calculated values.
6. Click Write.
7. Enable calibration in “Main” tab.

For LED color calibration a measurement of XYZ tristimulus value for each individual LED is needed.

Use NCV7430 Calibration Calculator Excel file to calculate the calibration constants or to calculate the Reference Tristimulus values (the smallest triangle).

Then set the Calibration Factors in Node Calibration tab according to calculated values and click Write. The Calibration Factors can be also calculated from Reference and measured values if these are available. The Calibration values are stored in Shadow Registers and result of the calibration can be checked by enabling calibration by Set_LED_Control command.
Figure 18. NCV7430 Evaluation – Node Configuration Tab

Figure 19. NCV7430 Evaluation – Node Calibration Tab
LIN Commands Tab

The LIN commands tab has two functions. It monitors all the LIN bus traffic and allows sending a custom frame. Transmitted or received commands are listed in a table together with a time stamp and description of the frame. In the Frame Creator group box, fill all the necessary fields and click the Data transfer button to send the custom frame.

![Figure 20. NCV7430 Evaluation – LIN Commands Tab](image-url)
**User Script Language Tab**

User Script Language is a simple tool for automatic execution of basic functions of NCV7430 LED Driver. You can create your own script in built-in editor using supported functions, and one-row comments starting with ‘//’. This USL is not case-sensitive. For correct syntax please see description of supported functions or code example.

The scripts can be saved or opened to/from text file. Files created in built-in editor are saved with *.usl extension.

---

**Supported Functions**

- **Set_Color function** – To send writing frame `Set_Color`
- **Set_LED_Control function** – To send writing frame `Set_LED_Control`
- **Delay function** – To define time space between two commands
- **Custom Frame function** – To send arbitrary Lin frame
- **Repeat function** – Allows to create loops

---

```plaintext
//*******************************************************
// Delay(d)
//   d - time delay in milliseconds
//*******************************************************
