1.5 A, Step-Up/Down/Inverting Switching Regulators

The MC34063A Series is a monolithic control circuit containing the primary functions required for DC-to-DC converters. These devices consist of an internal temperature compensated reference, comparator, controlled duty cycle oscillator with an active current limit circuit, driver and high current output switch. This series was specifically designed to be incorporated in Step-Down and Step-Up and Voltage-Inverting applications with a minimum number of external components. Refer to Application Notes AN920A/D and AN954/D for additional design information.

Features
- Operation from 3.0 V to 40 V Input
- Low Standby Current
- Current Limiting
- Output Switch Current to 1.5 A
- Output Voltage Adjustable
- Frequency Operation to 100 kHz
- Precision 2% Reference
- NCV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC-Q100 Qualified and PPAP Capable
- These Devices are Pb-Free, Halogen Free/BFR Free and are RoHS Compliant

Figure 1. Representative Schematic Diagram

This device contains 79 active transistors.

ORDERING INFORMATION
See detailed ordering and shipping information in the package dimensions section on page 12 of this data sheet.

</table>

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. Maximum package power dissipation limits must be observed.
2. This device series contains ESD protection and exceeds the following tests: Human Body Model 4000 V per MIL−STD−883, Method 3015. Machine Model Method 400 V.
3. NCV prefix is for automotive and other applications requiring site and change control.

</tbody>
</table>

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

4. Tlow = 0°C for MC34063, SC34063; −40°C for MC33063, SC33063, MC33063V, NCV33063

5. Thigh = +70°C for MC33063, NCV33063; +85°C for MC33063, SC33063; +125°C for MC33063V, NCV33063

5. Low duty cycle pulse techniques are used during test to maintain junction temperature as close to ambient temperature as possible.

6. If the output switch is driven into hard saturation (non–Darlington configuration) at low switch currents (≤ 300 mA) and high driver currents (≥ 30 mA), it may take up to 2.0 µs for it to come out of saturation. This condition will shorten the off time at frequencies ≥ 30 kHz, and is magnified at high temperatures. This condition does not occur with a Darlington configuration, since the output switch cannot saturate. If a non–Darlington configuration is used, the following output drive condition is recommended:

\[
\text{I}_{\text{C output}} = \frac{\text{I}_{\text{C driver}} - 7.0 \text{ mA}}{10}
\]

* The 100 Ω resistor in the emitter of the driver device requires about 7.0 mA before the output switch conducts.

</tr>
</tbody>
</table>

### Notes:
- \( V_{sat} \) = Saturation voltage of the output switch.
- \( V_F \) = Forward voltage drop of the output rectifier.

**The following power supply characteristics must be chosen:**
- \( V_{in} \) = Nominal input voltage.
- \( V_{out} \) = Desired output voltage, \( |V_{out}| = 1.25 \left( 1 + \frac{R_2}{R_1} \right) \)
- \( I_{out} \) = Desired output current.
- \( f_{min} \) = Minimum desired output switching frequency at the selected values of \( V_{in} \) and \( I_{out} \).
- \( V_{ripple(pp)} \) = Desired peak-to-peak output ripple voltage. In practice, the calculated capacitor value will need to be increased due to its equivalent series resistance and board layout. The ripple voltage should be kept to a low value since it will directly affect the line and load regulation.

**NOTE:** For further information refer to Application Note AN920A/D and AN954/D.
