# DUSEU

# Low-Voltage 16-Bit **Buffer/Line Driver with 3.6 V Tolerant Inputs and Outputs** and 26 $\Omega$ Series Resistor in Outputs

# 74ALVC162244

#### **General Description**

The ALVC162244 contains sixteen non-inverting buffers with 3-STATE outputs to be employed as a memory and address driver, clock driver, or bus oriented transmitter/receiver. The device is nibble (4-bit) controlled. Each nibble has separate 3-STATE control inputs which can be shorted together for full 16-bit operation.

The 74ALVC162244 is designed for low voltage (1.65 V to 3.6 V) V<sub>CC</sub> applications with I/O capability up to 3.6 V. The 74ALVC162244 is also designed with 26  $\Omega$  series resistors in the outputs. This design reduces line noise in applications such as memory address drivers. clock drivers, and bus transceivers/transmitters.

NOT RECONNEROR The 74ALVC162244 is fabricated with an advanced CMOS technology to achieve high speed operation while maintaining low CMOS power dissipation.

#### **Functional Description**

The 74ALVC162244 contains sixteen non-inverting buffers with 3–STATE outputs. The device is nibble (4 bits) controlled with each nibble functioning identically, but independent of each other. The control pins may be shorted together to obtain full 16-bit operation. The 3-STATE outputs are controlled by an Output Enable  $(\overline{OE}_n)$  input. When  $\overline{OE}_n$  is LOW, the outputs are in the 2-state mode. When  $\overline{OE}_n$  is HIGH, the standard outputs are in the high impedance mode but this does not interfere with entering new data into the inputs.
