

Octal D-Type Flip-Flop with 3-STATE Outputs

74VHCT574A

TSSOP20, 4.4x6.5
CASE 948AQ

General Description

The VHCT574A is an advanced high speed CMOS octal flip-flop with 3-STATE output fabricated with silicon gate CMOS technology. It achieves the high speed operation similar to equivalent Bipolar Schottky TTL while maintaining the CMOS low power dissipation. This 8-bit D-type flip-flop is controlled by a clock input (CP) and an Output Enable input (\overline{OE}). When the \overline{OE} input is HIGH, the eight outputs are in a high impedance state.

Protection circuits ensure that 0 V to 5.5 V can be applied to the input and output (Note 1) pins without regard to the supply voltage. This device can be used to interface 3 V to 5 V systems and two supply systems such as battery back up. This circuit prevents device destruction due to mismatched supply and input voltages.

NOTE:

1. Outputs in OFF-State.

Functional Description

The VHCT574A consists of eight edge-triggered flip-flops with individual D-type inputs and 3-STATE true outputs. The buffered clock and buffered Output Enable are common to all flip-flops. The eight flip-flops will store the state of their individual D inputs that meet the setup and hold time requirements on the LOW-to-HIGH Clock (CP) transition. With the Output Enable (\overline{OE}) LOW, the contents of the eight flip-flops are available at the outputs. When the \overline{OE} is HIGH, the outputs go to the high impedance state. Operation of the \overline{OE} input does not affect the state of the flip-flops.

The total C_{PD} when n pcs. of the Octal D Flip-Flop operates can be calculated by the equation: C_{PD} (total) = 20 + 12n.
