To learn more about ON Semiconductor, please visit our website at www.onsemi.com

Please note: As part of the Fairchild Semiconductor integration, some of the Fairchild orderable part numbers will need to change in order to meet ON Semiconductor’s system requirements. Since the ON Semiconductor product management systems do not have the ability to manage part nomenclature that utilizes an underscore (_), the underscore (_) in the Fairchild part numbers will be changed to a dash (-). This document may contain device numbers with an underscore (_). Please check the ON Semiconductor website to verify the updated device numbers. The most current and up-to-date ordering information can be found at www.onsemi.com. Please email any questions regarding the system integration to Fairchild_questions@onsemi.com.
FAN5640 — Dual High-Side Constant Current Source for High-Voltage Keypad LED Illumination

Features
- 20V Maximum Driver Input Level
- Dual Output
- 25mA Drive Capability per Channel
- Two Strings of 2-4 LEDs Each
- External Resistor Sets Maximum Current
- Fast Turn-On/Off Capability
- Low Bias Current
- SC70-6 Package
- Thermal Shutdown Protection

Applications
- Keypad Illumination
- Main Display and Sub-Display Illumination
- Cell Phones, Smart Phones
- Pocket PCs
- PDA, DSC, PMP, and MP3 Players

Description
The FAN5640 is designed to illuminate one or two strings of keypad LEDs with constant high-side current sources.

The device can drive up to four white LEDs in series at a maximum current of 25mA per channel. If the second channel is not needed, the channels can be tied together to boost output current up to 50mA.

An external resistor programs the maximum output current. Dimming can be accomplished by pulse width modulation of the enable pin or the input supply rail.

Absolute Maximum Ratings

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

### Notes:

2. If only one channel is needed, IOU1 can be tied to IOU2 to boost maximum current to 50mA.
3. $R_{\text{EXT}}$ resistor tolerance adds to the specification limit of the pin RSET to determine overall current accuracy.
4. Matching defined as $\left(\frac{I_{\text{OUT1}} - I_{\text{OUT2}}}{I_{\text{OUT1}} + I_{\text{OUT2}}}\right) \times 100$.
5. $V_{\text{OUT}}$ is the total voltage drop across the LED string.
6. Measured from EN crossing 1.8V to output current reaching 90% of target $I_{\text{OUT}}$. 
Typical Characteristics

Unless otherwise noted, CIN = 4.7 µF, VEN=1.8V, TA = 25°C, white LED with Vf=3.3V at IOUT=10mA.

Application Information

Setting the Output Current Level
An internally generated reference current is mirrored on the MOSFETs connected to the outputs IOUT1 and IOUT2 (pins 1 and 6, respectively). The current mirror ratio is 275 (typical). The voltage on pin 3 (RSET) is 0.475V in steady state; therefore, the programmed current through each of the outputs is:

\[ I_{OUT} = 275 \times \frac{0.475}{R_{EXT}} \]

\[ \text{EQ. 1} \]

where \( R_{EXT} \) is the external resistor connected from pin 3 to ground. Increasing this external programming resistor reduces the output current. For the maximum rated 25mA rating of each output, the minimum value of the external resistor is:

\[ R_{EXT} = 275 \times \frac{0.475}{I_{OUT}} = 275 \times \frac{0.475}{0.025} = 5.225k\Omega \]

\[ \text{EQ. 2} \]

The LED output current accuracy is ±10% for 25mA current (see the Electrical Characteristics table). In the worst-case scenario, the calculated value of \( I_{OUT} \) can lead to an error of ±10% in the LED current. Since the tolerance of \( R_{EXT} \) also affects the LED current accuracy, a precision resistor should be chosen to have the least effect on the overall accuracy of the LED current (see Figure 12).

Floating vs. Tied Outputs
Unused outputs can be left floating. The current through is zero, regardless of the current programmed at pin 3. However, ESD protection is enhanced if the unused output pin is tied to VIN (pin 5).

If the two output pins are tied together, they can deliver a combined 50mA for the same programming resistor of 5.225kΩ.

External Capacitors
Because the FAN5640 is stable without capacitors on the outputs, no capacitors are recommended. Typical input decoupling usually present on incoming supply rails should suffice in most applications. If necessary, a small input capacitance may be placed between the input pin and ground without adverse effects.

Dropout Limitations
As for any LDO regulator, there are limitations on how close the input and output rails can be to maintain regulation. The minimum difference is referred to as the dropout. The relevant information is provided in the Typical Performance curve Dropout Voltage vs. LED Current (see Figure 8). The equation for the data is:

\[ V_{DO} = 0.35V + I_{OUT} \times 64\Omega \]

\[ \text{EQ. 3} \]

This is equivalent to an \( R_{DS} \) of 64Ω with an additional offset of 350mV. This equation is helpful in determining the minimum dissipation in the device and the lowest input voltage for a given application.

Multiple LED Displays
For portable applications, the FAN5640 can be powered from the output of any typical boost regulator. Multiple LED displays can be created with the FAN5640 powered from the output of the FAN5333, as shown in Figure 20. Note that the output voltage of the FAN5333 depends upon the number of LEDs in its output string. Being conscious of the minimum dropout requirements of the FAN5640; if three series LEDs are required to be present at its output, then the FAN5333 should have four series LEDs in its output string.

![Figure 20. LED Display Example](image-url)
**PWM Dimming**

PWM dimming can be implemented by toggling the enable (EN) pin (pin 4). The recommended PWM frequency range is 100Hz to 3kHz. For example, if the rise time is 2.2µs, the actual duty cycle applied internally to the output MOSFETs is slightly less than the duty cycle of the signal applied on the enable pin. This leads to a slight non-linearity in the measured LED current. That error is:

$$\frac{\Delta I_{\text{OUT}}}{I_{\text{OUT\_SET}}} = -\frac{(2.2\mu \times f_{\text{PWM}})}{D_{\text{PWM}}} \times 100\%$$  \hspace{1cm} \text{EQ. 4}

For example, at a PWM frequency of 3kHz, with an applied duty cycle of 10%, the typical error is:

$$\frac{\Delta I_{\text{OUT}}}{I_{\text{OUT\_SET}}} = -\frac{(2.2\mu \times 3k)}{0.1} \times 100 = -6.6\%$$  \hspace{1cm} \text{EQ. 5}

So, if $R_{\text{SET}}$ is 5.225kΩ, the theoretically expected LED current, with a PWM duty cycle of 10%, is 2.5mA. However, the actual (measured) LED current is less by 6.6%. It is (1-0.066) multiplied by 2.5mA, which is 2.335mA. In this way, the actual LED current for any PWM duty cycle and frequency can be estimated.

**Input Rail Dimming**

The LEDs can also be dimmed by modulating the input supply rail. See Figure 15, PWM Dimming By VIN Pin, under Typical Characteristics. A maximum frequency of 1kHz is recommended.

**Power Dissipation**

At an ambient temperature ($T_A$), the power dissipation ($P_D$) and the junction temperature ($T_J$) are related to each other as described in the following equation:

$$T_J = T_A + P_D \times \Theta_{JA}$$  \hspace{1cm} \text{EQ. 6}

where:

$$P_D = (V_{IN} - V_O) \times I_{\text{OUT\_Total}} + V_{IN} \times I_Q + \frac{V_{RSET}}{R_{\text{EXT}}} \times (V_{IN} - V_{RSET})$$

and

$$I_{\text{OUT\_Total}} = I_{\text{OUT\_1}} + I_{\text{OUT\_2}}$$

The quiescent current ($I_Q$) can be found in the Electrical Characteristics section. The junction-to-ambient thermal resistance ($\Theta_{JA}$) puts a limit on $V_O\_\text{MAX}$, $I_{\text{OUT\_MAX}}$, and the maximum dropout ($V_{IN}$-$V_O\_\text{MAX}$). This affects the number of LEDs used, the current used to drive them, and so on. Ensure that thermal shutdown does not occur. The formula that correlates all these variables is:

$$(V_{IN} - V_O)_{\text{MAX}} = \frac{T_{J\_\text{MAX}} - T_{A\_\text{MAX}}}{\Theta_{JA} \times I_{\text{OUT\_Total}}}$$  \hspace{1cm} \text{EQ. 7}

This should be solved for $T_{J\_\text{MAX}}$ and the result verified as less than the over-temperature shutdown threshold of 150ºC (typical). An additional 25ºC margin is recommended to account for tolerances on the shutdown threshold; $T_{J\_\text{MAX}}$ should not exceed 125ºC. The $\Theta_{JA}$ is dependent on the surrounding PCB layout and can be around 300ºC/W for an SC-70 package. This can be improved by providing a heat sink of surrounding copper ground on the PCB. The addition of backside copper with vias, stiffeners, and other enhancements can reduce this value. The heat contributed by the dissipation of other devices located nearby must be included in design considerations. Once the limiting parameters in these two relationships have been determined, the design can be modified to ensure that the device remains within specified operating conditions. If overload conditions are not considered, it is possible for the device to enter a thermal cycling loop, in which the circuit enters a shutdown condition, cools, re-enables, and again overheats and shuts down repeatedly due to an unmanaged fault condition.

**LED Selection**

The FAN5640 is designed to drive 2-4 LEDs or a higher number of monochrome LEDs. The maximum number of LEDs per channel can be calculated as a function of $V_{IN}$ and the sum of the forward voltage of each LED at the maximum specified current. The minimum number of LEDs driven by FAN5640 is the result of calculating the maximum power dissipated by the IC in the given operating conditions. The forward voltage of LEDs depends upon type of LEDs and the manufacturer. In terms of maximum number of LEDs and LED current, refer to the Dropout Voltage vs. LED Current graph in the Typical Characteristics (see Figure 8).

DISCLAIMER

FAIRCHILD SEMICONDUCTOR RESERVES THE RIGHT TO MAKE CHANGES WITHOUT FURTHER NOTICE TO ANY PRODUCTS HEREIN TO IMPROVE RELIABILITY, FUNCTION, OR DESIGN. FAIRCHILD DOES NOT ASSUME ANY LIABILITY ARISING OUT OF THE APPLICATION OR USE OF ANY PRODUCT OR CIRCUIT DESCRIBED HEREIN; NEITHER DOES IT CONVEY ANY LICENSE UNDER ITS PATENT RIGHTS, NOR THE RIGHTS OF OTHERS. THESE SPECIFICATIONS DO NOT EXPAND THE TERMS OF FAIRCHILD'S WORLDWIDE TERMS AND CONDITIONS, SPECIFICALLY THE WARRANTY THEREIN, WHICH COVERS THESE PRODUCTS.

LIFE SUPPORT POLICY

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF FAIRCHILD SEMICONDUCTOR CORPORATION.

As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.

2. A critical component in any component of a life support device, or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

ANTI-COUNTERFEITING POLICY

Fairchild Semiconductor Corporation’s Anti-Counterfeiting Policy. Fairchild’s Anti-Counterfeiting Policy is also stated on our external website, www.fairchildsemi.com, under Sales Support.

Counterfeiting of semiconductor parts is a growing problem in the industry. All manufacturers of semiconductor products are experiencing counterfeiting of their parts. Customers who inadvertently purchase counterfeit parts experience many problems such as loss of brand reputation, substandard performance, failed applications, and increased cost of production and manufacturing delays. Fairchild is taking strong measures to protect ourselves and our customers from the proliferation of counterfeit parts. Fairchild strongly encourages customers to purchase Fairchild parts either directly from Fairchild or from Authorized Fairchild Distributors who are listed by country on our web page cited above. Products customers buy either from Fairchild directly or from Authorized Fairchild Distributors are genuine parts, have full traceability, meet Fairchild’s quality standards for handling and storage and provide access to Fairchild’s full range of up-to-date technical and product information. Fairchild and our Authorized Distributors will stand behind all warranties and will appropriately address any warranty issues that may arise. Fairchild will not provide any warranty coverage or other assistance for parts bought from Unauthorized Sources. Fairchild is committed to combat this global problem and encourage our customers to do their part in stopping this practice by buying direct or from authorized distributors.
