

# Automotive Gate Driver IC, High and Low Side

## 600 V, 4.5 A

### FAN7191-F085, FAD7191

#### Description

The FAN7191 / FAD7191 is a monolithic high- and low-side gate-driver IC, which can drive high speed MOSFETs and IGBTs that operate up to +600 V. It has a buffered output stage with all NMOS transistors designed for high pulse driving capability and minimum cross-conduction.

ON Semiconductor's high-voltage process and common-mode noise canceling technique provide stable operation of high-drivers under high dV/dt noise circumstances. An advanced level-shift circuit allows high-side gate driver operation up to  $V_S = -9.8$  V (typical) for  $V_{BS} = 15$  V.

The UVLO circuit prevents malfunction when  $V_{DD}$  and  $V_{BS}$  are lower than the specified threshold voltage.

The high current and low output voltage drop features make this device suitable for controlling direct injection actuators and for use in many automotive DC-DC converter and motor control applications.

#### Features

- Floating Channel for Bootstrap Operation to +600 V
- 4.5 A Sourcing and 4.5 A Sinking Current Driving Capability
- Common-Mode dV/dt Noise Cancelling Circuit
- Built-in Under-Voltage Lockout for Both Channels
- Matched Propagation Delay for Both Channels
- 3.3 V and 5 V Input Logic Compatible
- Output In-phase with Input
- Enable Pin (For 14-SOP Package Only)
- 14-SOP with Separate Signal and Power Ground for Enhanced Noise Immunity
- 14-SOP with Increased Clearance for High Voltage Applications
- Automotive Applications, AEC Qualified and PPAP Capable
- These Devices are Pb-Free and are RoHS Compliant

#### Applications

- Electric and Hybrid Electric Vehicles
- 48 V Mild Hybrid Vehicles
- Automotive High Voltage DC-DC converters
- Motor Control (Fans, Pumps, Compressors)
- Advanced Fuel Injection Systems
- Starter/Alternator
- Electric Power Steering
- MOSFET and IGBT Driver Applications

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. Mounted on  $76.2 \times 114.3 \times 1.6$  mm PCB (FR-4 glass epoxy material).
2. Refer to the following standards: JESD51-2: Integral circuits thermal test method environmental conditions – natural convection. JESD51-3: Low effective thermal conductivity test board for leaded surface mount packages.
3.  $P_D$  is the power that raises  $T_J$  to  $150^{\circ}\text{C}$  for  $T_A = 25^{\circ}\text{C}$ .  $P_D$  to be derated at higher ambient temperature.
4. Minimum input pulse width that guarantee to produce an output pulse. Valid for turn on and turn off pulse width.
