## FNB43060T2

FNB43060T2 is an advanced Motion SPM 45 module providing a fully-featured, high-performance inverter output stage for AC Induction, BLDC, and PMSM motors. These modules integrate optimized gate drive of the built-in IGBTs to minimize EMI and losses, while also providing multiple on-module protection features including under-voltage lockouts, over-current shutdown, thermal monitoring of drive IC, and fault reporting. The built-in, high-speed HVIC requires only a single supply voltage and translates the incoming logic-level gate inputs to the high-voltage, high-current drive signals required to properly drive the module's internal IGBTs. Separate negative IGBT terminals are available for each phase to support the widest variety of control algorithms.

### Features

- UL Certified No. E209204 (UL1557)
- 600 V – 30 A 3-Phase IGBT Inverter with Integral Gate Drivers and Protection
- Low Thermal Resistance Using Ceramic Substrate
- Low-Loss, Short-Circuit Rated IGBTs
- Built-In Bootstrap Diodes and Dedicated Vs Pins Simplify PCB Layout
- Built-In NTC Thermistor for Temperature Monitoring
- Separate Open-Emitter Pins from Low-Side IGBTs for Three-Phase Current Sensing
- Single-Grounded Power Supply
- Isolation Rating: 2000 V<sub>rms</sub>/min.

### Applications

- Motion Control – Home Appliance / Industrial Motor

### Integrated Power Functions

- 600 V – 30 A IGBT inverter for three-phase DC / AC power conversion (please refer to Figure 2)

### Integrated Drive, Protection and System Control Functions

- For Inverter High-side IGBTs: gate drive circuit, high-voltage isolated high-speed level shifting control circuit Under-Voltage Lock-Out Protection (UVLO)(Note: Available bootstrap circuit example is given in Figure 14)
- For Inverter Low-side IGBTs: gate drive circuit, Short-Circuit Protection (SCP) control supply circuit Under-Voltage Lock-Out protection (UVLO)
- Fault Signaling: corresponding to UVLO (low-side supply) and SC faults
- Input Interface: High-active interface, works with 3.3 / 5 V logic, Schmitt trigger input

## INTERNAL EQUIVALENT CIRCUIT AND INPUT/OUTPUT PINS

### Notes:

1. Inverter high-side is composed of three IGBTs, freewheeling diodes, and one control IC for each IGBT.
2. Inverter low-side is composed of three IGBTs, freewheeling diodes, and one control IC for each IGBT. It has gate drive and protection functions.
3. Inverter power side is composed of four inverter DC-link input terminals and three inverter output terminals.

**NOTES:**

- 12. Do not make over torque when mounting screws. Much mounting torque may cause ceramic cracks, as well as bolts and Al heat-sink destruction.
- 13. Avoid one-sided tightening stress. Figure 9 shows the recommended torque order for mounting screws. Uneven mounting can cause the ceramic substrate of package to be damaged. The pre-screwing torque is set to 20 ~ 30% of maximum torque rating.

## INPUT/OUTPUT INTERFACE CIRCUIT

NOTE:

14. RC coupling at each input might change depending on the PWM control scheme used in the application and the wiring impedance of the application's printed circuit board. The input signal section of the Motion SPM 45 product integrates 5 kΩ (typ.) pull-down resistor. Therefore, when using an external filtering resistor, please pay attention to the signal voltage drop at input terminal.

**Figure 13. Recommended MCU I/O Interface Circuit**

# FNB43060T2

**Figure 14. Typical Application Circuit**

**NOTES:**

15. To avoid malfunction, the wiring of each input should be as short as possible (less than 2 ~ 3 cm).
16. V<sub>FO</sub> output is open-drain type. This signal line should be pulled up to the positive side of the MCU or control power supply with a resistor that makes I<sub>FO</sub> up to 1 mA.
17. C<sub>SP15</sub> of around seven times larger than bootstrap capacitor C<sub>BS</sub> is recommended.
18. Input signal is active-HIGH type. There is a 5 kΩ resistor inside the IC to pull down each input signal line to GND. RC coupling circuits are recommended for the prevention of input signal oscillation. R<sub>S</sub>C<sub>PS</sub> time constant should be selected in the range 50 ~ 150 ns (recommended R<sub>S</sub> = 100 Ω, C<sub>PS</sub> = 1 nF).
19. To prevent errors of the protection function, the wiring around R<sub>F</sub> and C<sub>SC</sub> should be as short as possible.
20. In the short-circuit protection circuit, please select the R<sub>F</sub>C<sub>SC</sub> time constant in the range 1.5 ~ 2 μs. Do enough evaluation on the real system because short-circuit protection time may vary wiring pattern layout and value of the R<sub>F</sub>C<sub>SC</sub> time constant.
21. The connection between control GND line and power GND line which includes the N<sub>U</sub>, N<sub>V</sub>, N<sub>W</sub> must be connected to only one point. Please do not connect the control GND to the power GND by the broad pattern. Also, the wiring distance between control GND and power GND should be as short as possible.
22. Each capacitor should be mounted as close to the pins of the Motion SPM 45 product as possible.
23. To prevent surge destruction, the wiring between the smoothing capacitor and the P & GND pins should be as short as possible. The use of a high-frequency non-inductive capacitor of around 0.1 ~ 0.22 μF between the P and GND pins is recommended.
24. Relays are used in almost every systems of electrical equipment in home appliances. In these cases, there should be sufficient distance between the MCU and the relays.
25. The zener diode or transient voltage suppressor should be adopted for the protection of ICs from the surge destruction between each pair of control supply terminals (recommended zener diode is 22 V / 1 W, which has the lower zener impedance characteristic than about 15 Ω).
26. Please choose the electrolytic capacitor with good temperature characteristic in C<sub>BS</sub>. Also, choose 0.1 ~ 0.2 μF R-category ceramic capacitors with good temperature and frequency characteristics in C<sub>BSC</sub>.
