## FSB50250BS

### Description

The FSB50250BS is an advanced Motion SPM5 module providing a fully-featured, high-performance inverter output stage for AC Induction, BLDC and PMSM motors such as refrigerators, fans and pumps. These modules integrate optimized gate drive of the built-in MOSFETs (FRFET technology) to minimize EMI and losses, while also providing multiple on-module protection features including under-voltage lockouts and thermal monitoring. The built-in high-speed HVIC requires only a single supply voltage and translates the incoming logic-level gate inputs to the high-voltage, high-current drive signals required to properly drive the module's internal MOSFETs. Separate open-source MOSFET terminals are available for each phase to support the widest variety of control algorithms.

### NOTES:

- $BV_{DSS}$  is the Absolute Maximum Voltage Rating Between Drain and Source Terminal of Each MOSFET Inside Motion SPM 5 product.  $V_{PN}$  Should be Sufficiently Less Than This Value Considering the Effect of the Stray Inductance so that  $V_{DS}$  Should Not Exceed  $BV_{DSS}$  in Any Case.
- $t_{ON}$  and  $t_{OFF}$  Include the Propagation Delay Time of the Internal Drive IC. Listed Values are Measured at the Laboratory Test Condition, and They Can be Different According to the Field Applications Due to the Effect of Different Printed Circuit Boards and Wirings. Please see Figure 6 for the Switching Time Definition with the Switching Test Circuit of Figure 7.
- The peak current and voltage of each MOSFET during the switching operation should be included in the Safe Operating Area (SOA). Please see Figure 8 for the RBSOA test circuit that is same as the switching test circuit.
- $V_{TS}$  is only for sensing temperature of module and cannot shutdown MOSFETs automatically.
- Built in bootstrap diode includes around 15  $\Omega$  resistance characteristic. Please refer to Figure 1.

**FSB50250BS**

*These values depend on PWM control algorithm*

10. Parameters for bootstrap circuit elements are dependent on PWM algorithm. For 15 kHz of switching frequency, typical example of parameters is shown above.
11. RC-coupling ( $R_5$  and  $C_5$ ) and  $C_4$  at each input of Motion SPM 5 product and MCU (Indicated as Dotted Lines) may be used to prevent improper signal due to surge-noise.
12. Bold lines should be short and thick in PCB pattern to have small stray inductance of circuit, which results in the reduction of surge-voltage. Bypass capacitors such as  $C_1$ ,  $C_2$  and  $C_3$  should have good high-frequency characteristics to absorb high-frequency ripple-current.

### Figure 3. Recommended MCU Interface and Bootstrap Circuit with Parameters

13. Attach the thermocouple on top of the heat-sink of SPM 5 package (between SPM 5 package and heatsink if applied) to get the correct temperature measurement.

14. About pin position, refer to Figure 1.
15. RC-coupling ( $R_5$  and  $C_5$ ,  $R_4$  and  $C_6$ ) and  $C_4$  at each input of Motion SPM 5 product and MCU are useful to prevent improper input signal caused by surge-noise.
16. The voltage-drop across  $R_3$  affects the low-side switching performance and the bootstrap characteristics since it is placed between COM and the source terminal of the low-side MOSFET. For this reason, the voltage-drop across  $R_3$  should be less than 1 V in the steady-state.
17. Ground-wires and output terminals, should be thick and short in order to avoid surge-voltage and malfunction of HVIC.
18. All the filter capacitors should be connected close to Motion SPM 5 product, and they should have good characteristics for rejecting high-frequency ripple current.
