MC74HC161A, MC74HC163A

Presettable Counters

High−Performance Silicon−Gate CMOS

The MC74HC161A and HC163A are identical in pinout to the LS161 and LS163. The device inputs are compatible with standard CMOS outputs; with pullup resistors, they are compatible with LSTTL outputs.

The HC161A and HC163A are programmable 4−bit binary counters with asynchronous and synchronous reset, respectively.

Features

- Output Drive Capability: 10 LSTTL Loads
- Outputs Directly Interface to CMOS, NMOS, and TTL
- Operating Voltage Range: 2.0 to 6.0 V
- Low Input Current: 1.0 μA
- High Noise Immunity Characteristic of CMOS Devices
- In Compliance with the Requirements Defined by JEDEC Standard No. 7A
- Chip Complexity: 192 FETs or 48 Equivalent Gates
- These are Pb−Free Devices

FUNCTION DESCRIPTION

The HC161A/163A are programmable 4−bit synchronous counters that feature parallel Load, synchronous or asynchronous Reset, a Carry Output for cascading, and count−enable controls.

The HC161A and HC163A are binary counters with asynchronous Reset and synchronous Reset, respectively.

INPUTS

Clock (Pin 2)

The internal flip−flops toggle and the output count advances with the rising edge of the Clock input. In addition, control functions, such as resetting and loading, occur with the rising edge of the Clock input.

Preset Data Inputs P0, P1, P2, P3 (Pins 3, 4, 5, 6)

These are the data inputs for programmable counting. Data on these pins may be synchronously loaded into the internal flip−flops and appear at the counter outputs. P0 (Pin 3) is the least−significant bit and P3 (Pin 6) is the most−significant bit.

OUTPUTS

Q0, Q1, Q2, Q3 (Pins 14, 13, 12, 11)

These are the counter outputs. Q0 (Pin 14) is the least−significant bit and Q3 (Pin 11) is the most−significant bit.

Ripple Carry Out (Pin 15)

When the counter is in its maximum state, 1111, this output goes high, providing an external look−ahead carry pulse that may be used to enable successive cascaded counters. Ripple Carry Out remains high only during the maximum count state. The logic equation for this output is:

Ripple Carry Out = Enable T • Q0 • Q1 • Q2 • Q3

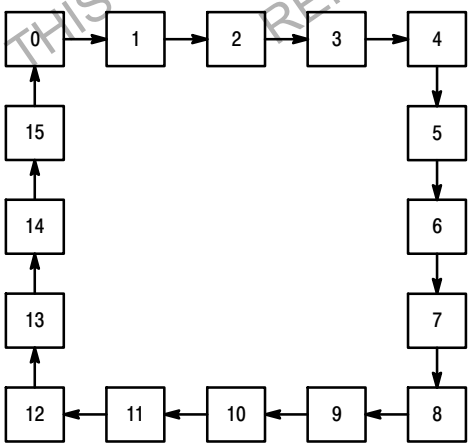

Figure 3. Binary Counters

CONTROL FUNCTIONS

Resetting

A low level on the Reset pin (Pin 1) resets the internal flip−flops and sets the outputs (Q0 through Q3) to a low level. The HC161A resets asynchronously, and the HC163A resets with the rising edge of the Clock input (synchronous reset).

Loading

With the rising edge of the Clock, a low level on Load (Pin 9) loads the data from the Preset Data input pins (P0, P1, P2, P3) into the internal flip−flops and onto the output pins, Q0 through Q3. The count function is disabled as long as Load is low.

Count Enable/Disable

These devices have two count−enable control pins: Enable P (Pin 7) and Enable T (Pin 10). The devices count when these two pins and the Load pin are high. The logic equation is:

Count Enable = Enable P • Enable T • Load

The count is either enabled or disabled by the control inputs according to Table 1. In general, Enable P is a count−enable control: Enable T is both a count−enable and a Ripple−Carry Output control.

Table 1. Count Enable/Disable

Control Inputs			Result at Outputs	
Load	Enable P	Enable T	Q0 − Q3	Ripple Carry Out
H	H	H	Count	High when Q0−Q3 are maximum*
L	H	H	No Count	
X	L	H	No Count	High when Q0−Q3 are maximum*
X	X	L	No Count	L

*Q0 through Q3 are maximum when Q3, Q2, Q1, Q0 = 1111.

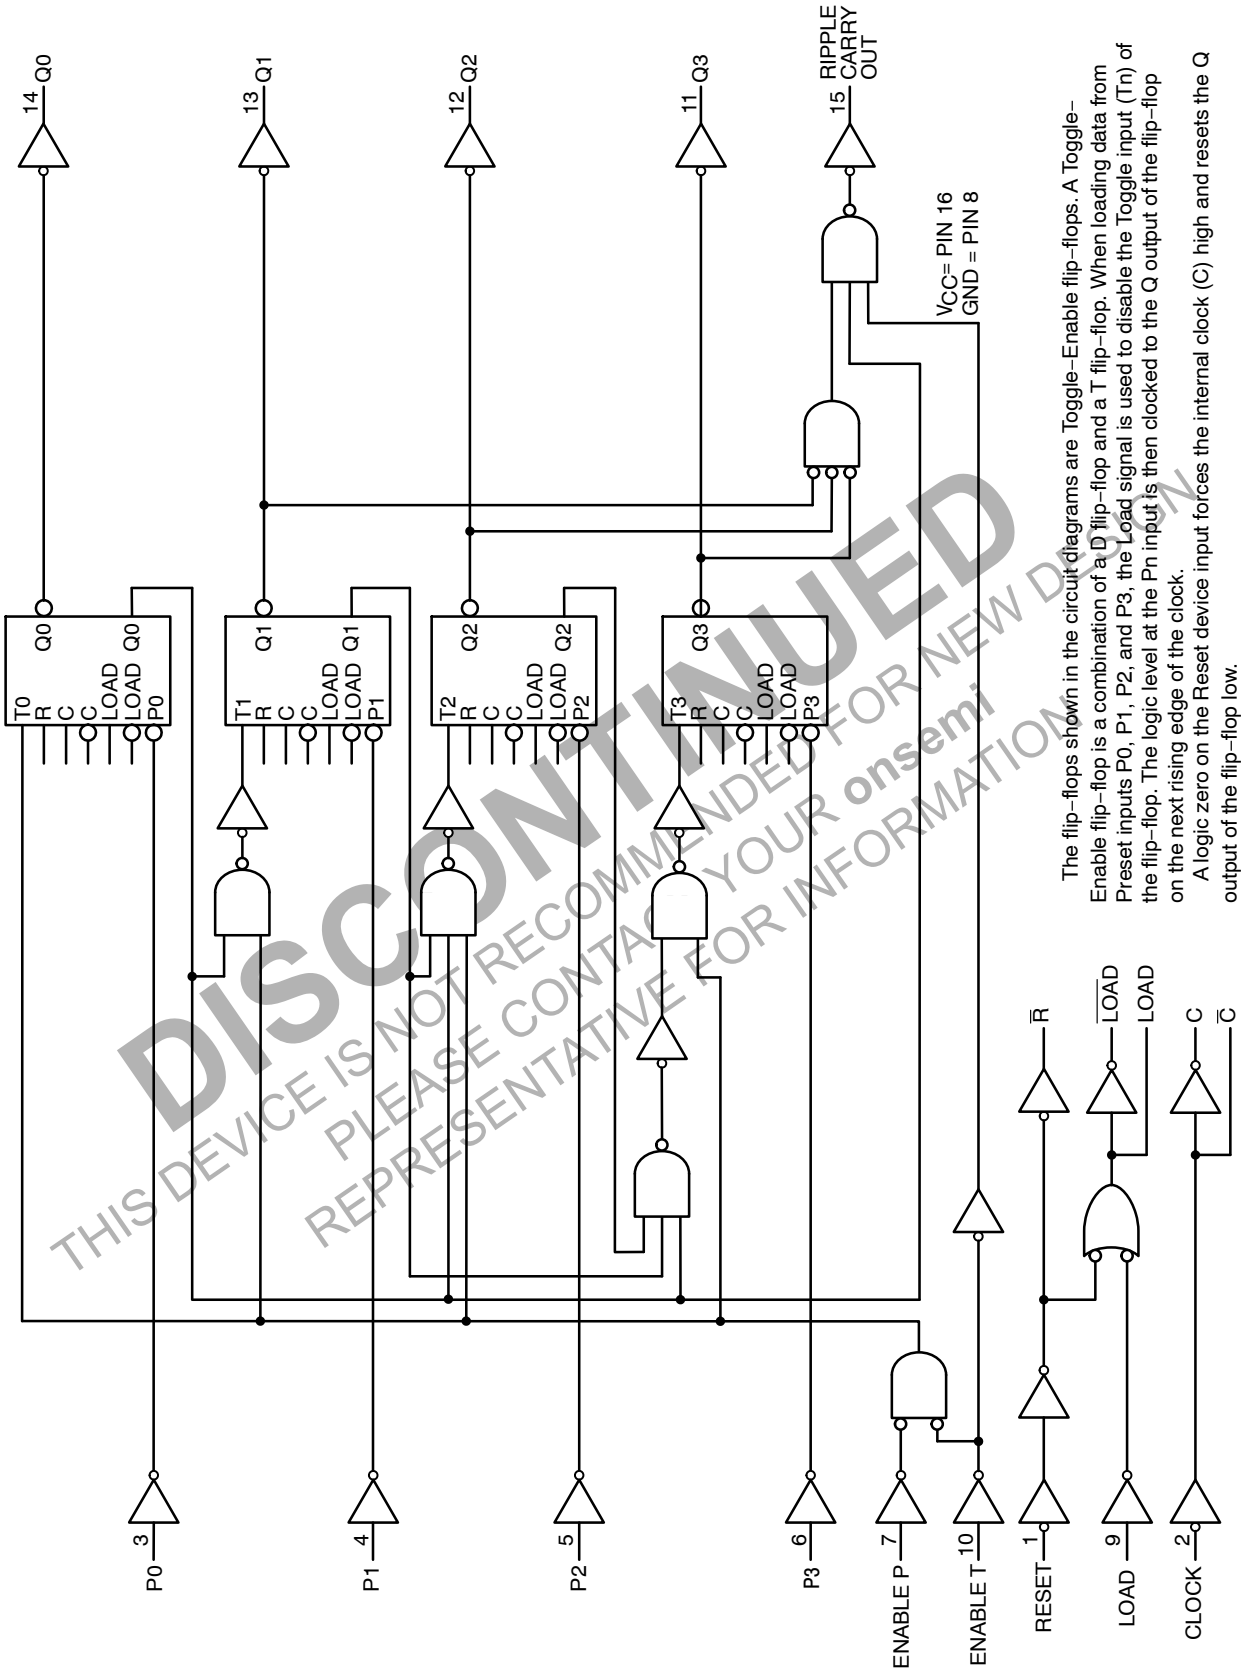
Figure 10.



The flip−flops shown in the circuit diagrams are Toggle−Enable flip−flops. A Toggle−Enable flip−flop is a combination of a D flip−flop and a T flip−flop. When loading data from Preset inputs P0, P1, P2, and P3, the Load signal is used to disable the Toggle input (Tn) of the flip−flop. The logic level at the Pn input is then clocked to the Q output of the flip−flop on the next rising edge of the clock.

A logic zero on the Reset device input forces the internal clock (C) high and resets the Q output of the flip−flop low.

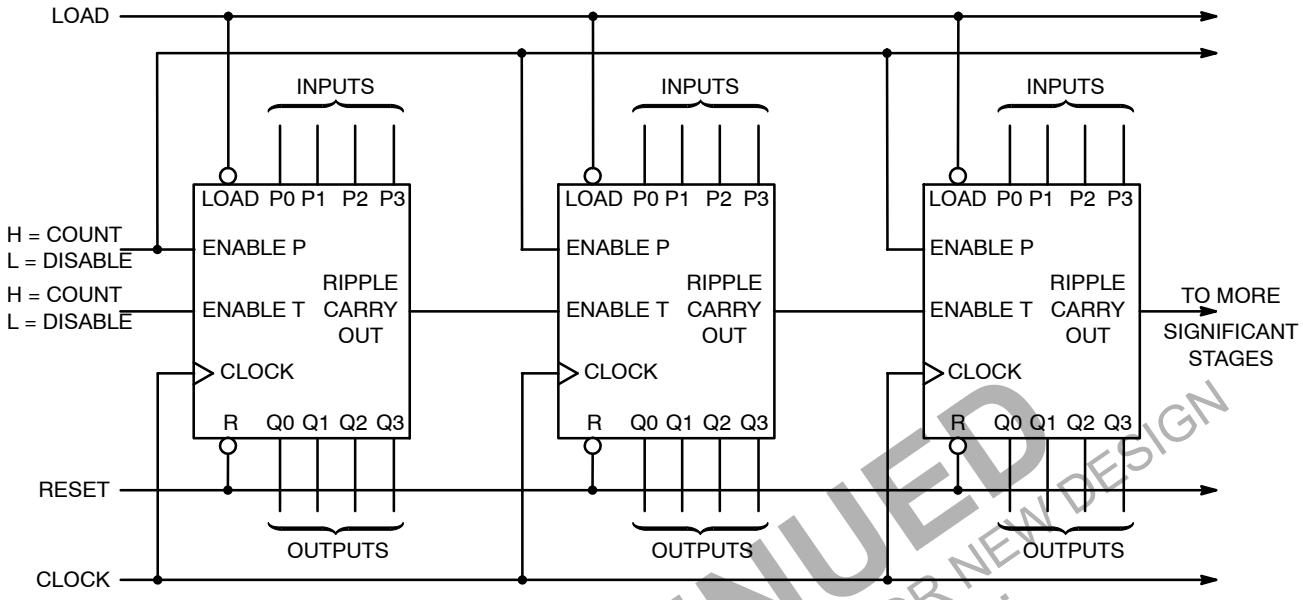
TYPICAL APPLICATIONS CASCADING



NOTE: When used in these cascaded configurations the clock f_{max} guaranteed limits may not apply. Actual performance will depend on number of stages. This limitation is due to set up times between Enable (Port) and Clock.

The HC163A facilitates designing counters of any modulus with minimal external logic. The output is glitch−free due to the synchronous Reset.
