

Quad Analog Switch/ Multiplexer/Demultiplexer with Separate Analog and Digital Power Supplies

High-Performance Silicon-Gate CMOS

MC74HC4316A

The MC74HC4316A utilizes silicon-gate CMOS technology to achieve fast propagation delays, low ON resistances, and low OFF-channel leakage current. This bilateral switch/multiplexer/demultiplexer controls analog and digital voltages that may vary across the full analog power-supply range (from V_{CC} to V_{EE}).

The HC4316A is similar in function to the metal-gate CMOS MC14016 and MC14066, and to the High-Speed CMOS HC4066A. Each device has four independent switches. The device control and Enable inputs are compatible with standard CMOS outputs; with pullup resistors, they are compatible with LSTTL outputs. The device has been designed so that the ON resistances (R_{ON}) are much more linear over input voltage than R_{ON} of metal-gate CMOS analog switches. Logic-level translators are provided so that the On/Off Control and Enable logic-level voltages need only be V_{CC} and GND, while the switch is passing signals ranging between V_{CC} and V_{EE} . When the Enable pin (active-low) is high, all four analog switches are turned off.

Features

- Logic-Level Translator for On/Off Control and Enable Inputs
- Fast Switching and Propagation Speeds
- High ON/OFF Output Voltage Ratio
- Diode Protection on All Inputs/Outputs
- Analog Power-Supply Voltage Range ($V_{CC} - V_{EE}$) = 2.0 to 12.0 V
- Digital (Control) Power-Supply Voltage Range ($V_{CC} - GND$) = 2.0 V to 6.0 V, Independent of V_{EE}
- Improved Linearity of ON Resistance
- Chip Complexity: 66 FETs or 16.5 Equivalent Gates
- NLV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC-Q100 Qualified and PPAP Capable*
- These Devices are Pb-Free, Halogen Free and are RoHS Compliant

T _L	Lead Temperature, 1 mm from Case for 10 Seconds)	260	°C

This device contains protection circuitry to guard against damage due to high static voltages or electric fields. However, precautions must be taken to avoid applications of any voltage higher than maximum rated voltages to this high-impedance circuit. For proper operation, V_{in} and V_{out} should be constrained to the range GND ≤ (V_{in} or V_{out}) ≤ V_{CC}. Unused inputs must always be tied to an appropriate logic voltage level (e.g., either GND or V_{CC}). Unused outputs must be left open. I/O pins must be connected to a properly terminated line or bus.

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

*Derating – SOIC Package: −7 mW/°C from 65° to 125°C

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

*For voltage drops across the switch greater than 1.2 V (switch on), excessive V_{CC} current may be drawn; i.e., the current out of the switch may contain both V_{CC} and switch input components. The reliability of the device will be unaffected unless the Maximum Ratings are exceeded.

APPLICATIONS INFORMATION

Figure 15. Plot, Harmonic Distortion

The Enable and Control pins should be at V_{CC} or GND logic levels, V_{CC} being recognized as logic high and GND being recognized as a logic low. Unused analog inputs/outputs may be left floating (not connected). However, it is advisable to tie unused analog inputs and outputs to V_{CC} or V_{EE} through a low value resistor. This minimizes crosstalk and feedthrough noise that may be picked up by the unused I/O pins.

The maximum analog voltage swings are determined by the supply voltages V_{CC} and V_{EE} . The positive peak analog voltage should not exceed V_{CC} . Similarly, the negative peak analog voltage should not go below V_{EE} . In the example below, the difference between V_{CC} and V_{EE} is 12 V.

Figure 16.

Therefore, using the configuration in Figure 16, a maximum analog signal of twelve volts peak-to-peak can be controlled.

When voltage transients above V_{CC} and/or below V_{EE} are anticipated on the analog channels, external diodes (D_x) are recommended as shown in Figure 17. These diodes should be small signal, fast turn-on types able to absorb the maximum anticipated current surges during clipping. An alternate method would be to replace the D_x diodes with MOSORBs (MOSORB[®] is an acronym for high current surge protectors). MOSORBs are fast turn-on devices ideally suited for precise dc protection with no inherent wear out mechanism.
