

256 Kb I²C CMOS Serial EEPROM in WLCSP Package

N24C256

Description

The N24C256 is a 256 Kb Serial CMOS EEPROM, internally organized as 32768 words of 8 bits each.

They feature a 64-byte page write buffer and support both the Standard (100 kHz), Fast (400 kHz) and Fast-Plus (1 MHz) I²C protocol.

The Write Protect input allows hardware protection for the memory array. The A2 input allows two N24C256 devices to be connected to the same bus.

Features

- Supports Standard, Fast and Fast-Plus I²C Protocol
- Two Selectable I²C Device Addresses
- 1.7 V to 5.5 V Supply Voltage Range
- 64-byte Page Write Buffer
- Schmitt Triggers and Noise Suppression Filters on I²C Bus Inputs (SCL and SDA)
- Low Power CMOS Technology
- 1,000,000 Program/Erase Cycles
- 100 Year Data Retention
- Industrial Temperature Range: -40°C to +85°C
- Ultra-thin 6-ball WLCSP Package
- These Devices are Pb-Free, Halogen Free/BFR Free and are RoHS Compliant*

Figure 1. Functional Symbol

*For additional information on our Pb-Free strategy and soldering details, please download the onsemi Soldering and Mounting Techniques Reference Manual, SOLDERRM/D.

PIN CONFIGURATION

PIN FUNCTION

Pin Name	Function
SDA	Serial Data Input/Output
SCL	Serial Clock Input
V _{CC}	Power Supply
V _{SS}	Ground
WP	Hardware Write Protect
A2	Address Pin

MARKING DIAGRAM

- X = Specific Device Code
(See Ordering Information Table)
Y = Production Year (Last Digit)
W = Production Week Code

ORDERING INFORMATION

See detailed ordering, marking and shipping information on page 8 of this data sheet.

Table 1. ABSOLUTE MAXIMUM RATINGS

Parameter	Rating	Unit
Storage Temperature	-65 to +150	°C
Voltage on Any Pin with Respect to Ground (Note 1)	-0.5 to +6.5	V

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. The DC input voltage on any pin should not be lower than -0.5 V or higher than $V_{CC} + 1.0$ V. During transitions, the voltage on any pin may undershoot to no less than -1.5 V or overshoot to no more than $V_{CC} + 1.5$ V, for periods of less than 20 ns.

Table 2. RELIABILITY CHARACTERISTICS (Note 2)

Symbol	Parameter	Min	Unit
N_{END} (Note 3)	Endurance	1,000,000	Program/Erase Cycles
T_{DR} (Note 4)	Data Retention	100	Years

2. These parameters are tested initially and after a design or process change that affects the parameter according to appropriate AEC-Q100 and JEDEC test methods.

3. Page Mode, $V_{CC} = 5$ V, 25°C

4. $T_A = 55^\circ\text{C}$

Table 3. DC AND AC OPERATING CONDITIONS

Supply Voltage / Temperature Range	Operation
$V_{CC} = 1.7$ V to 5.5 V / $T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$	READ / WRITE
$V_{CC} = 1.6$ V to 5.5 V / $T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$	READ
$V_{CC} = 1.6$ V to 5.5 V / $T_A = 0^\circ\text{C}$ to $+85^\circ\text{C}$	WRITE

Table 4. D.C. OPERATING CHARACTERISTICS

Symbol	Parameter	Test Conditions	Min	Max	Unit
I_{CCR}	Read Current	Read, $f_{SCL} = 400$ kHz/1 MHz		1	mA
I_{CCW}	Write Current			2	mA
I_{SB}	Standby Current	All I/O Pins at GND or V_{CC}	$V_{CC} < 2.5$ V	1	μA
			$V_{CC} > 2.5$ V	2	
I_L	I/O Pin Leakage	Pin at GND or V_{CC}		2	μA
V_{IL1}	Input Low Voltage	$V_{CC} \geq 2.5$ V	-0.5	$0.3 V_{CC}$	V
V_{IL2}	Input Low Voltage	$V_{CC} < 2.5$ V	-0.5	$0.25 V_{CC}$	V
V_{IH1}	Input High Voltage	$V_{CC} \geq 2.5$ V	$0.7 V_{CC}$	$V_{CC} + 1$	V
V_{IH2}	Input High Voltage	$V_{CC} < 2.5$ V	$0.75 V_{CC}$	$V_{CC} + 1$	V
V_{OL1}	Output Low Voltage	$V_{CC} \geq 2.5$ V, $I_{OL} = 3.0$ mA		0.4	V
V_{OL2}	Output Low Voltage	$V_{CC} < 2.5$ V, $I_{OL} = 1.0$ mA		0.2	V

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

Table 5. PIN IMPEDANCE CHARACTERISTICS

Symbol	Parameter	Conditions	Max	Unit
C_{IN} (Note 5)	SDA I/O Pin Capacitance	$V_{IN} = 0$ V	8	pF
C_{IN} (Note 5)	Input Capacitance (other pins)	$V_{IN} = 0$ V	6	pF

5. These parameters are tested initially and after a design or process change that affects the parameter according to appropriate AEC-Q100 and JEDEC test methods.

Table 6. A.C. CHARACTERISTICS (Note 6)

Symbol	Parameter	Standard $V_{CC} = 1.7 \text{ to } 5.5$ $T_A = -40 \text{ to } 85^\circ\text{C}$		Fast $V_{CC} = 1.7 \text{ to } 5.5$ $T_A = -40 \text{ to } 85^\circ\text{C}$		Fast-Plus $V_{CC} = 1.7 \text{ to } 5.5$ $T_A = -40 \text{ to } 85^\circ\text{C}$		Unit
		Min	Max	Min	Max	Min	Max	
F_{SCL}	Clock Frequency		100		400		1,000	kHz
$t_{HD:STA}$	START Condition Hold Time	4		0.6		0.25		μs
t_{LOW}	Low Period of SCL Clock	4.7		1.3		0.45		μs
t_{HIGH}	High Period of SCL Clock	4		0.6		0.40		μs
$t_{SU:STA}$	START Condition Setup Time	4.7		0.6		0.25		μs
$t_{HD:DAT}$	Data In Hold Time	0		0		0		μs
$t_{SU:DAT}$	Data In Setup Time	250		100		50		ns
t_R (Note 7)	SDA and SCL Rise Time		1,000	20	300		100	ns
t_F (Note 7)	SDA and SCL Fall Time		300	20	300		100	ns
$t_{SU:STO}$	STOP Condition Setup Time	4		0.6		0.25		μs
t_{BUF}	Bus Free Time Between STOP and START	4.7		1.3		0.5		μs
t_{AA}	SCL Low to Data Out Valid		3.5		0.9		0.40	μs
t_{DH}	Data Out Hold Time	100		100		50		ns
T_i (Note 7)	Noise Pulse Filtered at SCL and SDA Inputs		100		50		50	ns
t_{WR}	Write Cycle Time		5		5		5	ms
T_{PU} (Notes 7, 8)	Power-up to Ready Mode		0.35		0.35		0.35	ms

6. Test conditions according to "A.C. Test Conditions" table.

7. Tested initially and after a design or process change that affects this parameter.

8. t_{PU} is the delay between the time V_{CC} is stable and the device is ready to accept commands.

Table 7. A.C. TEST CONDITIONS

Parameter	Condition
Input Levels	$0.2 \times V_{CC}$ to $0.8 \times V_{CC}$
Input Rise and Fall Times	$\leq 50 \text{ ns}$
Input Reference Levels	$0.3 \times V_{CC}$, $0.7 \times V_{CC}$
Output Reference Levels	$0.5 \times V_{CC}$
Output Load	Current Source: $I_{OL} = 3 \text{ mA}$ ($V_{CC} \geq 2.5 \text{ V}$); $I_{OL} = 1 \text{ mA}$ ($V_{CC} < 2.5 \text{ V}$); $C_L = 100 \text{ pF}$

Figure 2. Maximum Pull-up Resistance vs. Load Capacitance

POWER-ON RESET (POR)

The N24C256 incorporates Power-On Reset (POR) circuitry which protects the device against powering up in the wrong state.

The N24C256 will power up into Standby mode after V_{CC} exceeds the POR trigger level and will power down into Reset mode when V_{CC} drops below the POR trigger level. This bi-directional POR feature protects the device against 'brown-out' failure following a temporary loss of power.

PIN DESCRIPTION

- **SCL:** The Serial Clock input pin accepts the Serial Clock generated by the Master.
- **SDA:** The Serial Data I/O pin receives input data and transmits data stored in EEPROM. In transmit mode, this pin is open drain. Data is acquired on the positive edge, and is delivered on the negative edge of SCL.
- **WP:** WP is the Write Protect pin. While the WP pin is connected to the power supply, the entire array becomes Write Protected (i.e. the device becomes Read only). When WP is tied to Ground or left floating, the normal write operations are allowed.
- **A2:** The A2 pin is a device address input. If A2 is left floating, the input defaults to zero. When A2 is set to logic-0 the device address is 0xA1/0xA0 for read/write. When A2 is set to logic-1 the device address is 0xA9/0xA8 for read/write.

FUNCTIONAL DESCRIPTION

The N24C256 supports the Inter-Integrated Circuit (I²C) Bus data transmission protocol, which defines a device that sends data to the bus as a transmitter and a device receiving data as a receiver. Data flow is controlled by a Master device, which generates the serial clock and all START and STOP conditions. The N24C256 acts as a Slave device. Master and Slave alternate as either transmitter or receiver.

I²C BUS PROTOCOL

The I²C bus consists of two 'wires', SCL and SDA. The two wires are connected to the V_{CC} supply via pull-up

resistors. Master and Slave devices connect to the 2-wire bus via their respective SCL and SDA pins. The transmitting device pulls down the SDA line to 'transmit' a '0' and releases it to 'transmit' a '1'.

Data transfer may be initiated only when the bus is not busy (see A.C. Characteristics).

During data transfer, the SDA line must remain stable while the SCL line is HIGH. An SDA transition while SCL is HIGH will be interpreted as a START or STOP condition (Figure 3). The START condition precedes all commands. It consists of a HIGH to LOW transition on SDA while SCL is HIGH. The STOP acts as a 'wake-up' call to all receivers. Absent a START, a Slave will not respond to commands. The STOP condition completes all commands. It consists of a LOW to HIGH transition on SDA while SCL is HIGH.

Device Addressing

The Master initiates data transfer by creating a START condition on the bus. The Master then broadcasts an 8-bit serial Slave address. The first 4 bits of the Slave address are set to 1010. The next 3 bits must match the logic state of A2, 0 and 0. The last bit, R/W, specifies whether a Read (1) or Write (0) operation is to be performed.

Acknowledge

After processing the Slave address, the Slave responds with an acknowledge (ACK) by pulling down the SDA line during the 9th clock cycle (Figure 5). The Slave will also acknowledge all address bytes and every data byte presented in Write mode if the addressed location is not write protected. In Read mode the Slave shifts out a data byte, and then releases the SDA line during the 9th clock cycle. As long as the Master acknowledges the data, the Slave will continue transmitting. The Master terminates the session by not acknowledging the last data byte (NoACK) and by issuing a STOP condition. Bus timing is illustrated in Figure 6.

---------------------	---	---	---	---	----	---	---	-----

Figure 4. Slave Address Bits

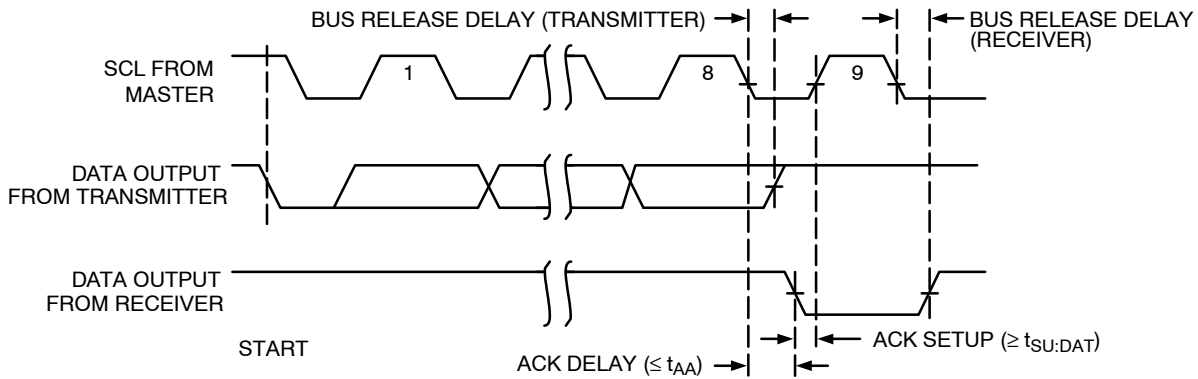

Figure 5. Acknowledge Timing

Figure 6. Bus Timing

WRITE OPERATIONS

Byte Write

In Byte Write mode the Master sends a START, followed by Slave address, two byte address and data to be written (Figure 7). The Slave, N24C256 acknowledges all 4 bytes, and the Master then follows up with a STOP, which in turn starts the internal Write operation (Figure 8). During the internal Write cycle (t_{WR}), the N24C256 will not acknowledge any Read or Write request from the Master.

Page Write

The N24C256 contains 32,768 bytes of data, arranged in 512 pages of 64 bytes each. A two byte address word, following the Slave address, points to the first byte to be written into the memory array. The most significant 8 bits

from the address active bits (a14 to a6) identify the page and the last 6 bits (a5 to a0) identify the byte within the page. Up to 64 bytes can be written in one Write cycle (Figure 9). The internal byte address counter is automatically incremented after each data byte is loaded. If the Master transmits more than 64 data bytes, then earlier bytes will be overwritten by later bytes in a 'wrap-around' fashion (within the selected page). The internal Write cycle starts immediately following the STOP.

Acknowledge Polling

The ready/busy status of the N24C256 can be ascertained by sending Read or Write requests immediately following the STOP condition that initiated the internal Write cycle. As long as internal Write is in progress, the N24C256 will not acknowledge the Slave address.

N24C256

Figure 7. Byte Write Sequence

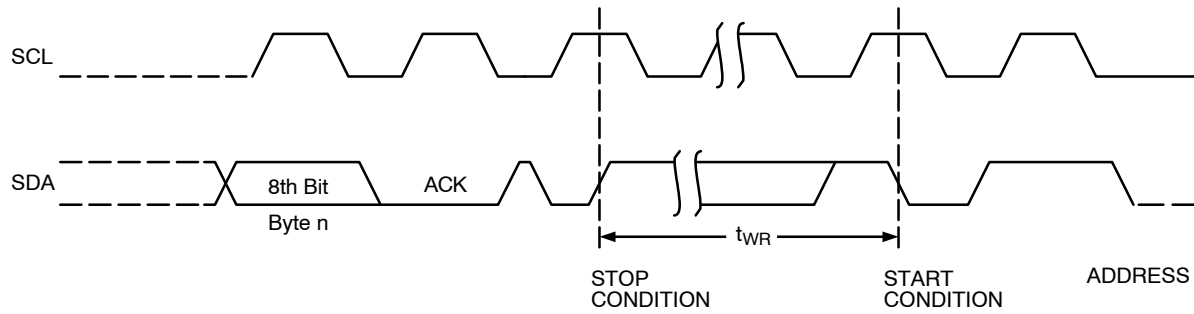

Figure 8. Write Cycle Timing

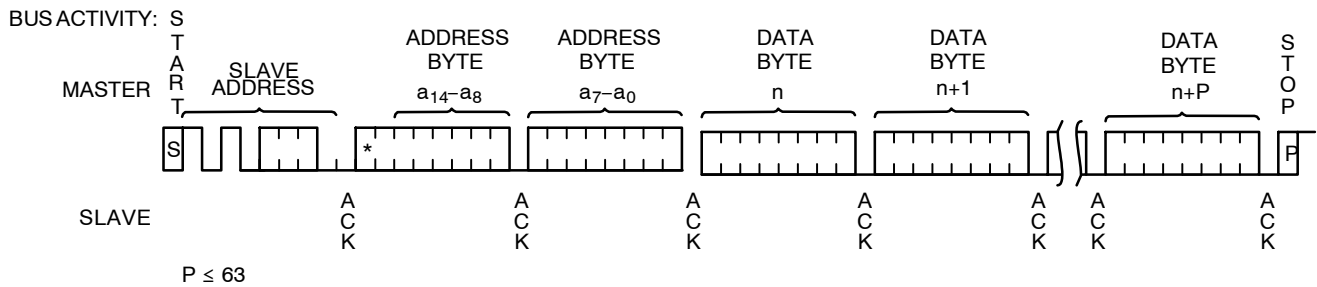

Figure 9. Page Write Sequence

READ OPERATIONS

Immediate Read

Upon receiving a Slave address with the R/\overline{W} bit set to '1', the N24C256 will interpret this as a request for data residing at the current byte address in memory. The N24C256 will acknowledge the Slave address, will immediately shift out the data residing at the current address, and will then wait for the Master to respond. If the Master does not acknowledge the data (NoACK) and then follows up with a STOP condition (Figure 10), the N24C256 returns to Standby mode.

Selective Read

To read data residing at a specific location, the internal address counter must first be initialized as described under Byte Write. If rather than following up the two address bytes with data, the Master instead follows up with an Immediate Read sequence, then the N24C256 will use the 14 active

address bits to initialize the internal address counter and will shift out data residing at the corresponding location. If the Master does not acknowledge the data (NoACK) and then follows up with a STOP condition (Figure 11), the N24C256 returns to Standby mode.

Sequential Read

If during a Read session the Master acknowledges the 1st data byte, then the N24C256 will continue transmitting data residing at subsequent locations until the Master responds with a NoACK, followed by a STOP (Figure 12). In contrast to Page Write, during Sequential Read the address count will automatically increment to and then wrap-around at end of memory (rather than end of page).

Delivery State

The N24C256 is shipped erased, i.e., all memory array bytes are FFh.
