NB7L86A

The NB7L86A is a multi-function differential Logic Gate which can be configured as an AND/NAND, OR/NOR, XOR/XNOR, or 2:1 MUX. This device is part of the GigaComm™ family of high performance Silicon Germanium products. The device is housed in a 3 x 3 mm 16 pin QFN package.

Differential inputs incorporate internal 50 Ω termination resistors and accept NECL (Negative ECL), PECL (Positive ECL), LVCMOS/LVTTL, CML, or LVDS. The Output Level Select (OLS) input is used to program the peak-to-peak output amplitude between 0 and 800 mV in five discrete steps.

The NB7L86A employs input default circuitry so that under open input condition (Dx , \overline{Dx} , $VTDx$, \overline{VTDx} , $VTSEL$) the Outputs of the device remains stable.

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

NOTE: Device will meet the specifications after thermal equilibrium has been established when mounted in a test socket or printed circuit board with maintained transverse airflow greater than 500 lfm.

21. Input and output parameters vary 1:1 with V_{CC} .

22. LVPECL outputs loaded with $50\ \Omega$ to $(V_{CC} - 2\text{ V})$ for proper operation.

23. V_{th} , V_{IH} , V_{IL} , and V_{ISE} parameters must be complied with simultaneously.

24. V_{th} is applied to the complementary input when operating in single-ended mode. $V_{th} = (V_{IH} - V_{IL}) / 2$.

25. V_{IHD} , V_{ILD} , V_{ID} and V_{CMR} parameters must be complied with simultaneously.

26. V_{IHCMR} min varies 1:1 with V_{EE} , V_{IHCMR} max varies 1:1 with V_{CC} . The V_{IHCMR} range is referenced to the most positive side of the differential input signal.

27. When an output level of 400 mV is desired and $V_{CC} - V_{EE} > 3.0\text{ V}$, a $2\text{ k}\Omega$ resistor should be connected from OLS to V_{EE} .

APPLICATION INFORMATION

All NB7L86A inputs can accept PECL, CML, LVTTTL, LVCMOS and LVDS signal levels. The limitations for differential input signal (LVDS, PECL, or CML) are minimum input swing of 75 mV and the maximum input swing of 2500 mV. Within these conditions, the input

voltage can range from V_{CC} to 1.2 V. Examples interfaces are illustrated below in a $50\ \Omega$ environment ($Z = 50\ \Omega$). For output termination and interface, refer to application note AND8020/D.

Table 14. INTERFACING OPTIONS

INTERFACING OPTIONS	CONNECTIONS
CML	Connect VTD and VTD to V_{CC} (refer Figure 18)
LVDS	Connect VTD and VTD together. (refer Figure 19)
AC-COUPLED	Bias VTD and VTD inputs within the Common Mode range (V_{CMR}) (refer Figure 20)
RSECL, PECL, NECL	Standard ECL termination techniques (refer Figure 21)
LVTTTL, LVCMOS	An external voltage (V_{THR}) should be applied to the unused complementary differential input. Nominal V_{THR} is 1.5 V for LVTTTL and $V_{CC}/2$ for LVCMOS inputs. This voltage must be within the V_{THR} specification (refer Figure 22)
