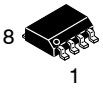
Dimmable Quasi-Resonant Primary Side Current-Mode Controller for LED Lighting with Thermal Fold-back NCL30082

Micro8
DM SUFFIX
CASE 846A



SOIC−8
D SUFFIX
CASE 751

The NCL30082 is a PWM current mode controller targeting isolated flyback and non−isolated constant current topologies. The controller operates in a quasi−resonant mode to provide high efficiency. Thanks to a novel control method, the device is able to precisely regulate a constant LED current from the primary side. This removes the need for secondary side feedback circuitry, biasing and an optocoupler.

The device is highly integrated with a minimum number of external components. A robust suite of safety protection is built in to simplify the design. This device supports analog/digital dimming as well as thermal current fold−back. While the NCL30082 has integrated fixed overvoltage protection, the designer has the flexibility to program a lower OVP level.

Features

- Quasi−resonant Peak Current−mode Control Operation
- Primary Side Sensing (no optocoupler needed)
- Wide V_{CC} Range
- Source 300 mA / Sink 500 mA Totem Pole Driver with 12 V Gate Clamp
- Precise LED Constant Current Regulation ±1% Typical
- Line Feed−forward for Enhanced Regulation Accuracy
- Low LED Current Ripple
- 250 mV ±2% Guaranteed Voltage Reference for Current Regulation
- ~0.9 Power Factor with Valley Fill Input Stage
- Low Start−up Current (13 μA typ.)
- Analog or Digital Dimming
- Thermal Fold−back
- Wide Temperature Range of −40 to +125°C
- Pb−Free, Halide−Free MSL1 Product
- Robust Protection Features
  - Over Voltage / LED Open Circuit Protection
  - Over Temperature Protection
  - Secondary Diode Short Protection
  - Output Short Circuit Protection
  - Shorted Current Sense Pin Fault Detection
  - Latched and Auto−recoverable Versions
  - Brown−out
  - V_{CC} Under Voltage Lockout
  - Thermal Shutdown
- These Devices are Pb−Free and Halogen Free/BFR Free

Typical Applications

- Integral LED Bulbs
- LED Power Driver Supplies
- LED Light Engines

ORDERING INFORMATION

See detailed ordering and shipping information on page 33 of this data sheet.

NOTE: Some of the devices on this data sheet have been **DISCONTINUED**. Please refer to the table on page 33.

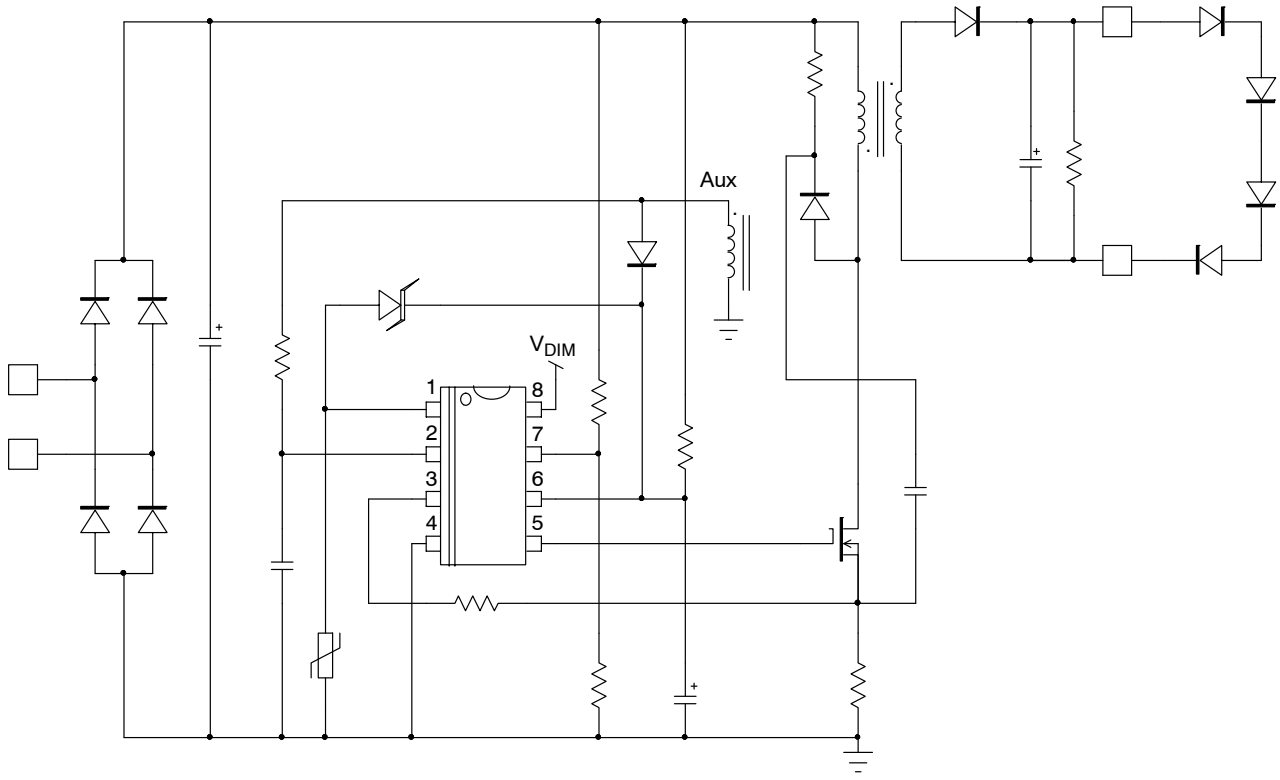

Figure 1. Typical Application Schematic for NCL30082

Table 1. PIN FUNCTION DESCRIPTION

Pin No	Pin Name	Function	Pin Description
1	SD	Thermal Fold−back and shutdown	Connecting an NTC to this pin allows reducing the output current down to 50% of its fixed value before stopping the controller. A Zener diode can also be used to pull−up the pin and stop the controller for adjustable OVP protection
2	ZCD	Zero Crossing Detection	Connected to the auxiliary winding, this pin detects the core reset event.
3	CS	Current sense	This pin monitors the primary peak current
4	GND	−	The controller ground
5	DRV	Driver output	The current capability of the totem pole gate drive (+0.3/−0.5 A) makes it suitable to effectively drive a broad range of power MOSFETs.
6	VCC	Supplies the controller	This pin is connected to an external auxiliary voltage.
7	VIN	Input voltage sensing Brown−Out	This pin observes the HV rail and is used in valley selection. This pin also monitors and protects for low mains conditions.
8	DIM	Analog / PWM dimming	This pin is used for analog or PWM dimming control. An analog signal than can be varied between $V_{DIM(EN)}$ and V_{DIM100} can be used to vary the current, or a PWM signal with an amplitude greater than V_{DIM100}.

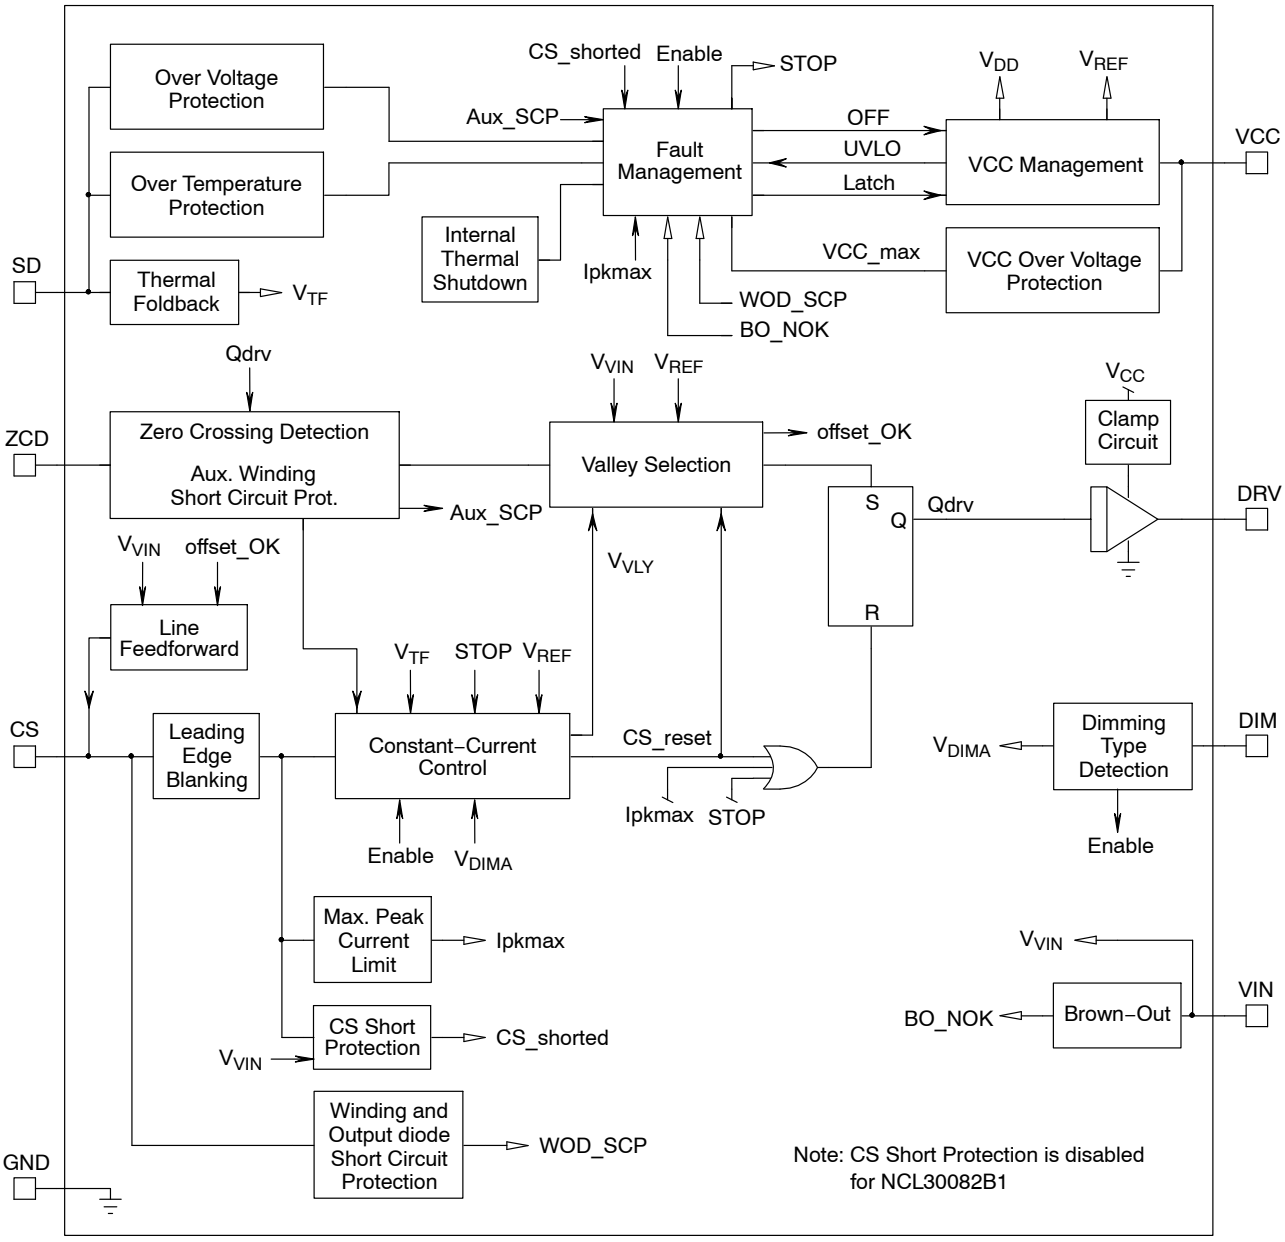

Figure 2. Internal Circuit Architecture

Table 2. MAXIMUM RATINGS TABLE

Symbol	Rating	Value	Unit
$V_{CC(MAX)}$ $I_{CC(MAX)}$	Maximum Power Supply voltage, VCC pin, continuous voltage Maximum current for VCC pin	−0.3, +35 Internally limited	V mA
$V_{DRV(MAX)}$ $I_{DRV(MAX)}$	Maximum driver pin voltage, DRV pin, continuous voltage Maximum current for DRV pin	−0.3, V_{DRV} (Note 1) −500, +800	V mA
V_{MAX} I_{MAX}	Maximum voltage on low power pins (except pins ZCD, DIM, DRV and VCC) Current range for low power pins (except pins ZCD, DRV and VCC)	−0.3, +5.5 −2, +5	V mA
$V_{ZCD(MAX)}$ $I_{ZCD(MAX)}$	Maximum voltage for ZCD pin Maximum current for ZCD pin	−0.3, +10 −2, +5	V mA
$V_{DIM(MAX)}$	Maximum voltage for DIM pin	−0.3, +10	V
$R_{\theta JA}$	Thermal Resistance, Junction−to−Ambient (Note 4) Micro8 version SOIC−8 version	 228 180	°C/W
Ψ_{JC}	Thermal Characterization Parameter, Junction−to−Case Top Micro8 version SOIC−8 version	 50 45	°C/W
$T_{J(MAX)}$	Maximum Junction Temperature	150	°C
	Operating Temperature Range	−40 to +125	°C
	Storage Temperature Range	−60 to +150	°C
	ESD Capability, HBM model (Note 2)	4	kV
	ESD Capability, MM model (Note 2)	200	V

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. V_{DRV} is the DRV clamp voltage $V_{DRV(high)}$ when V_{CC} is higher than $V_{DRV(high)}$. V_{DRV} is V_{CC} unless otherwise noted.
2. This device series contains ESD protection and exceeds the following tests: Human Body Model 4000 V per JEDEC JESD22−A114−F and Machine Model Method 200 V per JEDEC JESD22−A115−A.
3. This device contains latch−up protection and exceeds 100 mA per JEDEC Standard JESD78 except for VIN pin which passes 60 mA.
4. With a 100 mm^2, 2 oz copper area based on JEDEC EIA/JESD51-3 board design.

Table 3. ELECTRICAL CHARACTERISTICS (Unless otherwise noted: For typical values T_J = 25°C, V_{CC} = 12 V; For min/max values T_J = −40°C to +125°C, Max T_J = 150°C, V_{CC} = 12 V)

Description	Test Condition	Symbol	Min	Typ	Max	Unit
STARTUP AND SUPPLY CIRCUITS						
Supply Voltage						V
Startup Threshold	V_{CC} increasing	$V_{CC(on)}$	16	18	20	
Minimum Operating Voltage	V_{CC} decreasing	$V_{CC(off)}$	8.2	8.8	9.4	
Hysteresis $V_{CC(on)} - V_{CC(off)}$	V_{CC} decreasing	$V_{CC(HYS)}$	8	–	–	
Internal logic reset		$V_{CC(reset)}$	3.5	4.5	5.5	
Over Voltage Protection VCC OVP threshold		$V_{CC(OVP)}$	26	28	30	V
$V_{CC(off)}$ noise filter		$t_{VCC(off)}$	–	5	–	μs
$V_{CC(reset)}$ noise filter−		$t_{VCC(reset)}$	–	20	–	
Startup current		$I_{CC(start)}$	–	13	30	μA
Startup current in fault mode		$I_{CC(sFault)}$	–	46	60	μA
Supply Current						mA
Device Disabled/Fault	$V_{CC} > V_{CC(off)}$	I_{CC1}	0.8	1.2	1.4	
Device Enabled/No output load on pin 5	F_{sw} = 65 kHz	I_{CC2}	–	2.3	4.0	
Device Switching (F_{sw} = 65 kHz)	C_{DRV} = 470 pF, F_{sw} = 65 kHz	I_{CC3}	–	2.7	5.0	

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

6. Guaranteed by design.

Table 3. ELECTRICAL CHARACTERISTICS (Unless otherwise noted: For typical values T_J = 25°C, V_{CC} = 12 V; For min/max values T_J = −40°C to +125°C, Max T_J = 150°C, V_{CC} = 12 V)

Description	Test Condition	Symbol	Min	Typ	Max	Unit
CURRENT SENSE						
Maximum Internal current limit		V_{ILIM}	0.95	1	1.05	V
Leading Edge Blanking Duration for V_{ILIM} (T_j = −25°C to 125°C) (Not applicable for NCL30082D)		t_{LEB}	250	300	350	ns
Leading Edge Blanking Duration for V_{ILIM} (T_j = −40°C to 125°C)		t_{LEB}	240	300	350	ns

APPLICATION INFORMATION

The **NCL30082** implements a current−mode architecture operating in quasi−resonant mode. Thanks to proprietary circuitry, the controller is able to accurately regulate the secondary side current of the flyback converter without using any opto−coupler or measuring directly the secondary side current.

- **Quasi−Resonance Current−Mode Operation:** implementing quasi−resonance operation in peak current−mode control, the NCL30082 optimizes the efficiency by switching in the valley of the MOSFET drain−source voltage. Thanks to a smart control algorithm, the controller locks−out in a selected valley and remains locked until the input voltage or the output current set point significantly changes.
- **Primary Side Constant Current Control:** thanks to a proprietary circuit, the controller is able to compensate for the leakage inductance of the transformer and allow accurate control of the secondary side current.
- **Line Feed−forward:** compensation for possible variation of the output current caused by system slew rate variation.
- **Open LED protection:** if the voltage on the VCC pin exceeds an internal limit, the controller shuts down and waits 4 seconds before restarting switching.
- **Thermal Fold−back / Over Temperature / Over Voltage Protection:** by combining a dual threshold on the SD pin, the controller allows the direct connection of an NTC to ground plus a Zener diode to a monitored voltage. The temperature is monitored and the output current is linearly reduced in the event that the temperature exceeds a prescribed level. If the temperature continues to increase, the current will be further reduced until the controller is stopped. The control will automatically restart if the temperature is reduced. This pin can implement a programmable OVP shutdown that can also auto−restart the device.
- **Brown−Out:** the controller includes a brown−out circuit which safely stops the controller in case the input voltage is too low. The device will automatically restart if the line recovers.
- **Cycle−by−cycle peak current limit:** when the current sense voltage exceeds the internal threshold V_{ILIM}, the MOSFET is turned off for the rest of the switching cycle.
- **Winding Short−Circuit Protection:** an additional comparator with a short LEB filter (t_{BCS}) senses the CS signal and stops the controller if V_{CS} reaches 1.5 x V_{ILIM}. For noise immunity reasons, this comparator is enabled only during the main LEB duration t_{LEB}.
- **Output Short−circuit protection:** If a very low voltage is applied on ZCD pin for 90 ms (nominal), the controllers assume that the output or the ZCD pin is shorted to ground and enters shutdown. The auto−restart version (B suffix) waits 4 seconds, then the controller restarts switching. In the latched version (A suffix), the controller is latched as long as V_{CC} stays above the $V_{CC(reset)}$ threshold.
- **Linear or PWM dimming:** the DIM pin allows implementing both analog and PWM dimming.

Constant Current Control

Figure 53 portrays the primary and secondary current of a flyback converter in discontinuous conduction mode (DCM). Figure 52 shows the basic circuit of a flyback converter.

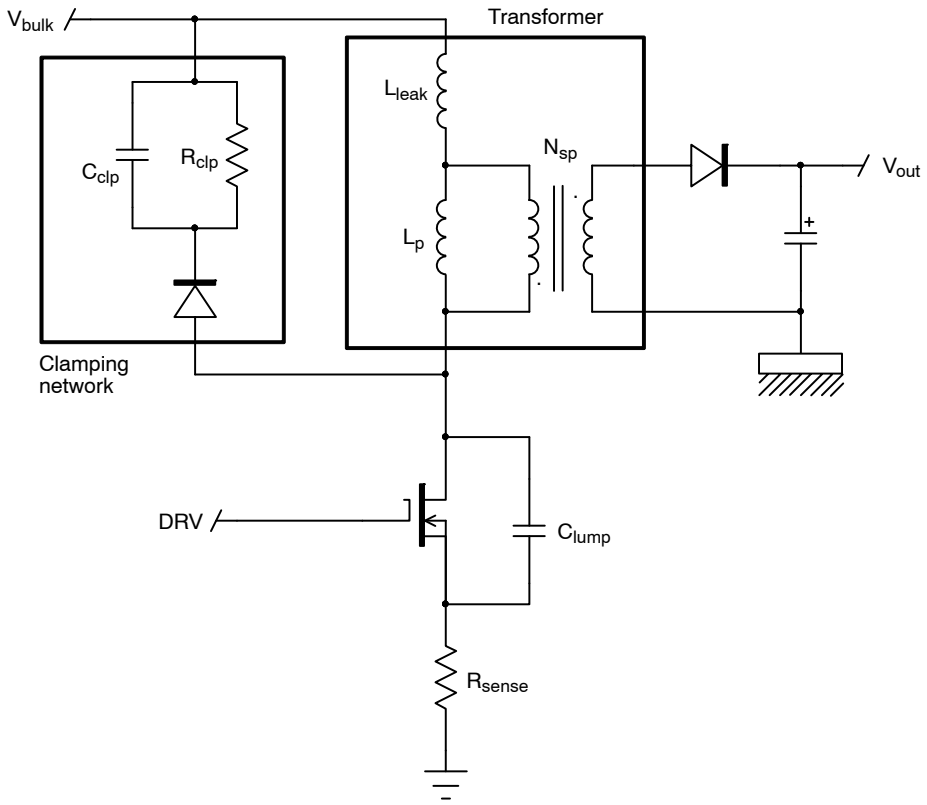

Figure 52. Basic Flyback Converter Schematic

During the on−time of the MOSFET, the bulk voltage V_{bulk} is applied to the magnetizing and leakage inductors L_p and L_{leak} and the current ramps up.

When the MOSFET is turned−off, the inductor current first charges C_{lump}. The output diode is off until the voltage across L_p reverses and reaches:

$$N_{sp}\left(V_{out} + V_f\right) \qquad \text{(eq. 1)}$$

The output diode current increase is limited by the leakage inductor. As a consequence, the secondary peak current is reduced:

$$I_{D,pk} < \frac{I_{L,pk}}{N_{sp}} \qquad \text{(eq. 2)}$$

The diode current reaches its peak when the leakage inductor is reset. Thus, in order to accurately regulate the output current, we need to take into account the leakage inductor current. This is accomplished by sensing the clamping network current. Practically, a node of the clamp capacitor is connected to R_{sense} instead of the bulk voltage V_{bulk}. Then, by reading the voltage on the CS pin, we have an image of the primary current (red curve in Figure 53).

When the diode conducts, the secondary current decreases linearly from $I_{D,pk}$ to zero. When the diode current has turned off, the drain voltage begins to oscillate because of the resonating network formed by the inductors (L_p+L_{leak}) and the lump capacitor. This voltage is reflected on the auxiliary winding wired in flyback mode. Thus, by looking at the auxiliary winding voltage, we can detect the end of the conduction time of secondary diode. The constant current control block picks up the leakage inductor current, the end of conduction of the output rectifier and controls the drain current to maintain the output current constant.

We have:

$$I_{out} = \frac{V_{REF}}{2N_{sp}R_{sense}} \qquad \text{(eq. 3)}$$

The output current value is set by choosing the sense resistor:

$$R_{sense} = \frac{V_{ref}}{2N_{sp}I_{out}} \qquad \text{(eq. 4)}$$

From Equation 3, the first key point is that the output current is independent of the inductor value. Moreover, the leakage inductance does not influence the output current value as the reset time is taken into account by the controller.

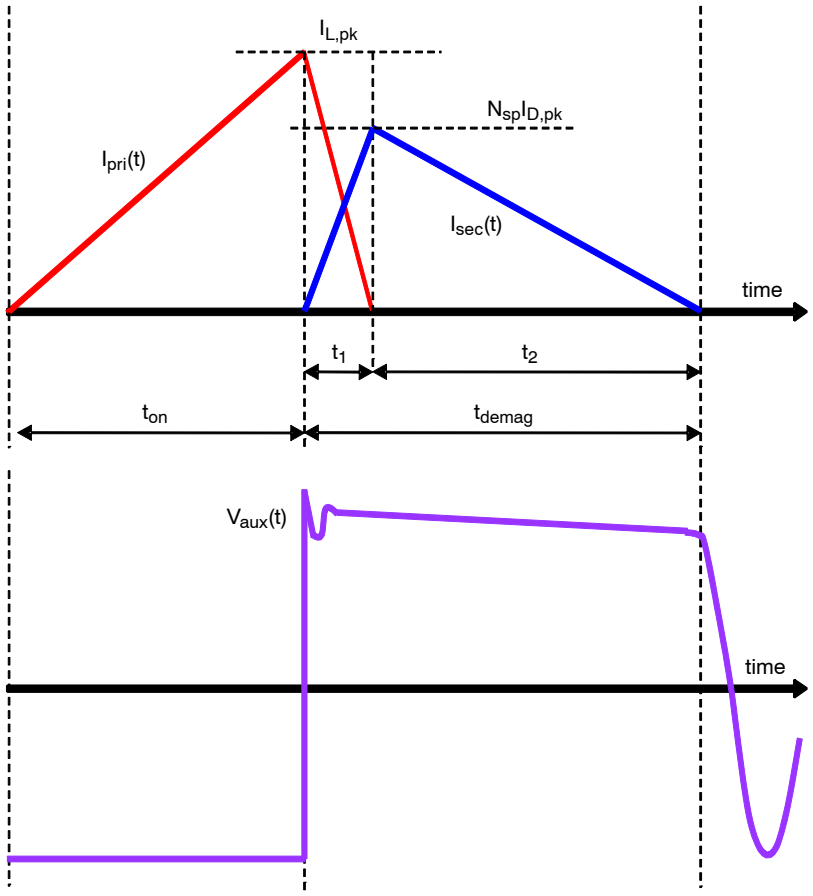

Figure 53. Flyback Currents and Auxiliary Winding Voltage in DCM

Internal Soft−Start

At startup or after recovering from a fault, there is a small internal soft−start of 40 μs.

In addition, during startup, as the output voltage is zero volts, the demagnetization time is long and the constant current control block will slowly increase the peak current towards its nominal value as the output voltage grows. Figure 54 shows a soft−start simulation example for a 9 W LED power supply.

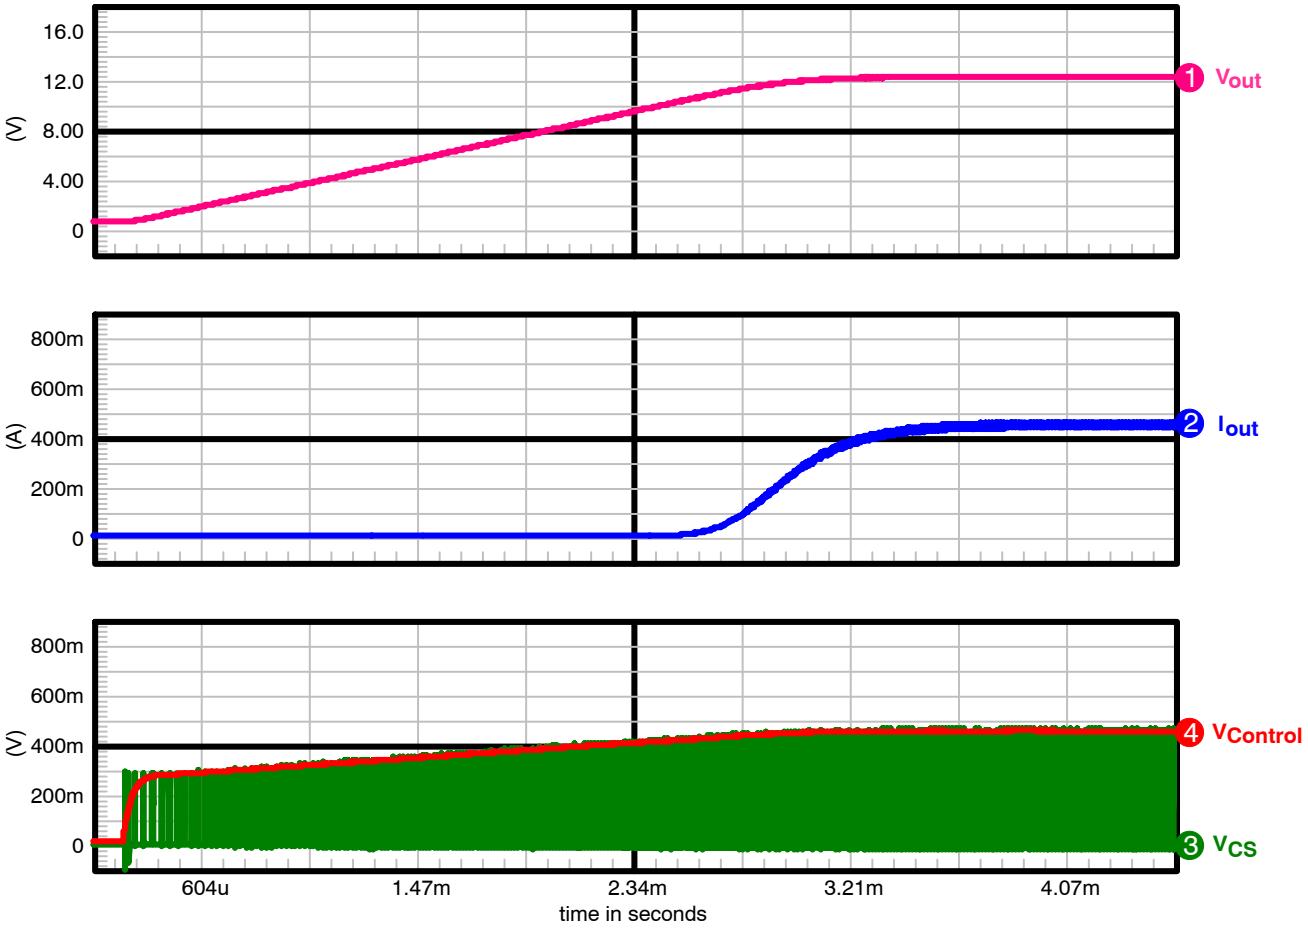

Figure 54. Startup Simulation Showing the Natural Soft−start

Cycle−by−Cycle Current Limit

When the current sense voltage exceeds the internal threshold V_{ILIM}, the MOSFET is turned off for the rest of the switching cycle (Figure 55).

Winding and Output Diode Short−Circuit Protection

In parallel with the cycle−by−cycle sensing of the CS pin, another comparator with a reduced LEB (t_{BCS}) and a higher threshold (1.5 V typical) is able to sense winding short−circuit and immediately stops the DRV pulses. The controller goes into auto−recovery mode in version B, B1, B2, B3 and D.

In version A, the controller is latched. In latch mode, the DRV pulses stop and VCC ramps up and down. The circuit un−latches when VCC pin voltage drops below $V_{CC(reset)}$ threshold.

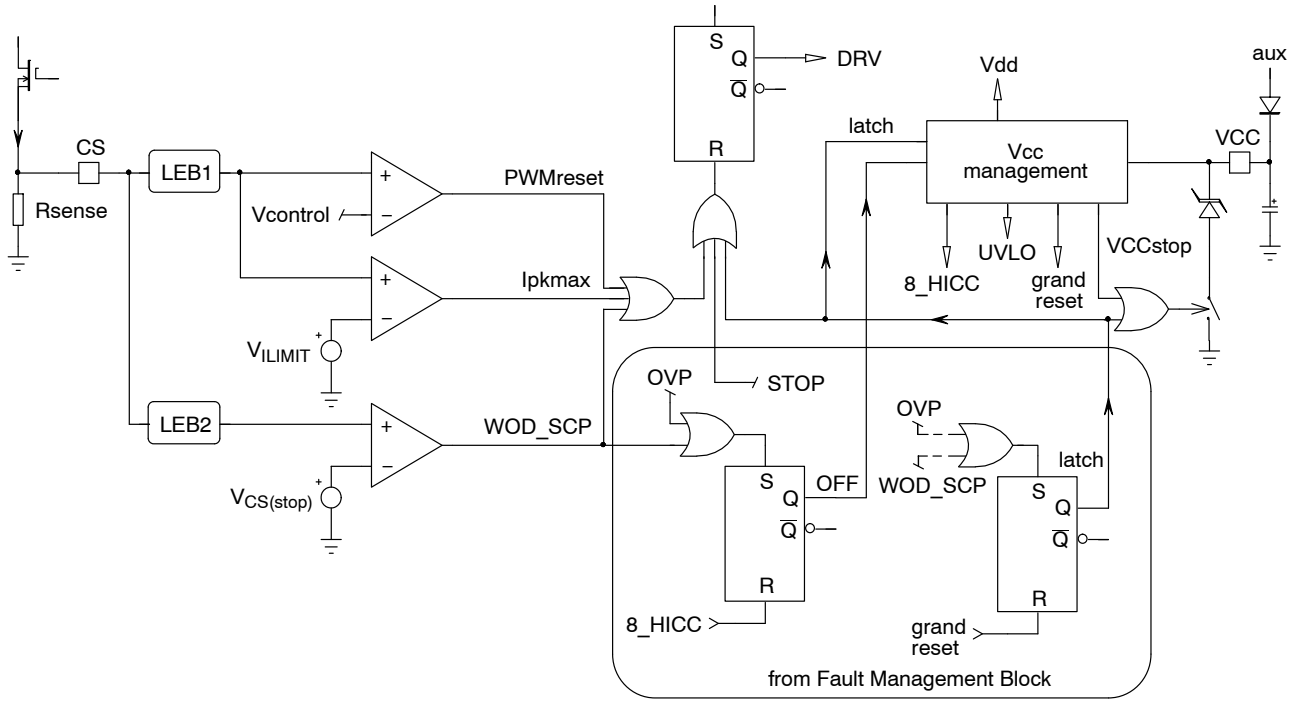

Figure 55. Winding Short Circuit Protection, Max. Peak Current Limit Circuits

Thermal Fold−back and Over Voltage / Over Temperature Protection

The thermal fold−back circuit reduces the current in the LED string when the ambient temperature exceeds a set point. The current is gradually reduced to 50% of its nominal value if the temperature continues to rise. (Figure 56). The thermal foldback starting temperature depends of the Negative Coefficient Temperature (NTC) resistor chosen by the power supply designer.

Indeed, the SD pin allows the direct connection of an NTC to sense the ambient temperature. When the SD pin voltage V_{SD} drops below $V_{TF(start)}$, the internal reference for the constant current control V_{REF} is decreased proportionally to V_{SD}. When V_{SD} reaches $V_{TF(stop)}$, V_{REF} is clamped to V_{REF50}, corresponding to 50% of the nominal output current (versions A, B, B1, B2, B3). For the NCL30082D, the output current is decreased to 25% of the nominal output current.

If V_{SD} drops below V_{OTP}, the controller enters into the auto−recovery fault mode for version B, B1, B2, B3 and D meaning that the 4−s timer is activated. The controller will re−start switching after the 4−s timer has elapsed and when $V_{SD} > V_{OTP(on)}$ to provide some temperature hysteresis.

For version A, this protection is latched: reset occurs when $V_{CC} < V_{CC(reset)}$.

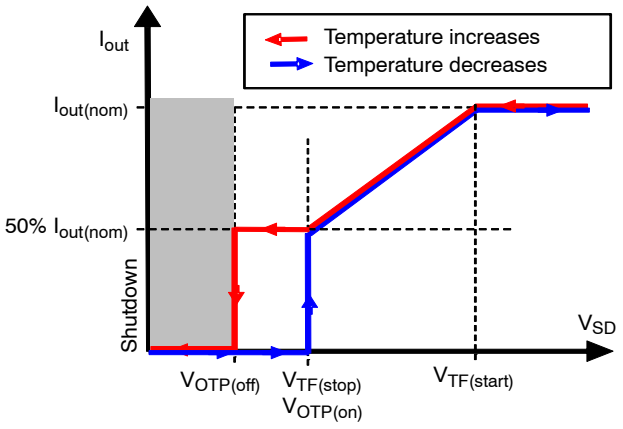

Figure 56. Output Current Reduction vs. SD Pin Voltage for NCL30082 Versions A, B, B1, B2, B3

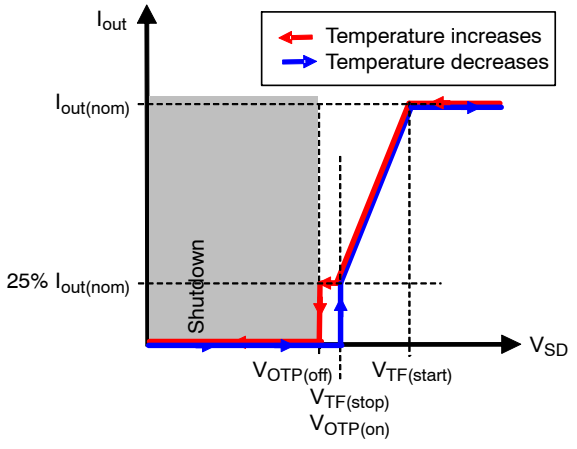

Figure 57. Output Current Reduction vs. SD Pin Voltage for NCL30082D

At startup, when V_{CC} reaches $V_{CC(on)}$, the controller is not allowed to start pulsing for at least 180 μs in order to allow the SD pin voltage to reach its nominal value if a filtering capacitor is connected to the SD pin. This is to avoid flickering of the LED light in case of over temperature.

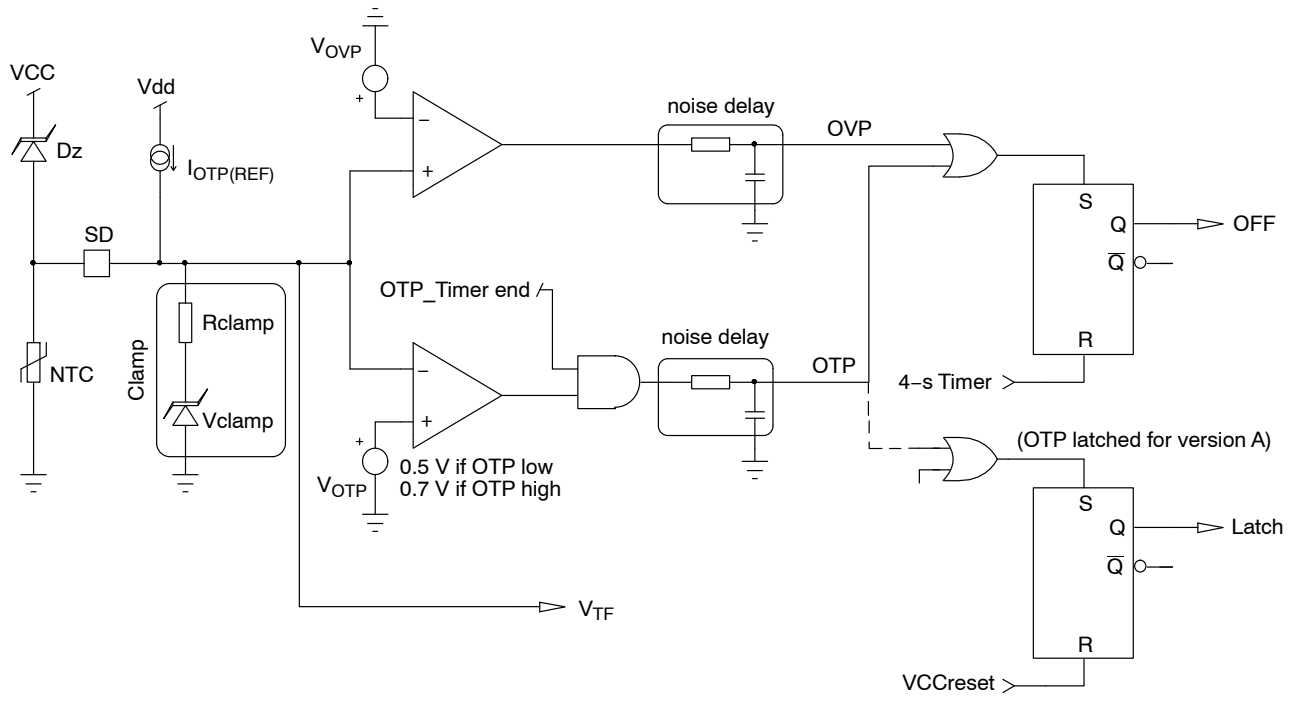

Figure 58. Thermal Fold−back and OVP/OTP Circuitry

In the case of excess voltage, the Zener diode starts to conduct and inject current into the internal clamp resistor R_{clamp} thus causing the pin SD voltage to increase. When this voltage reaches the OVP threshold (2.5 V typ.), the controller shuts−down and waits for at least 4 seconds before restarting switching.

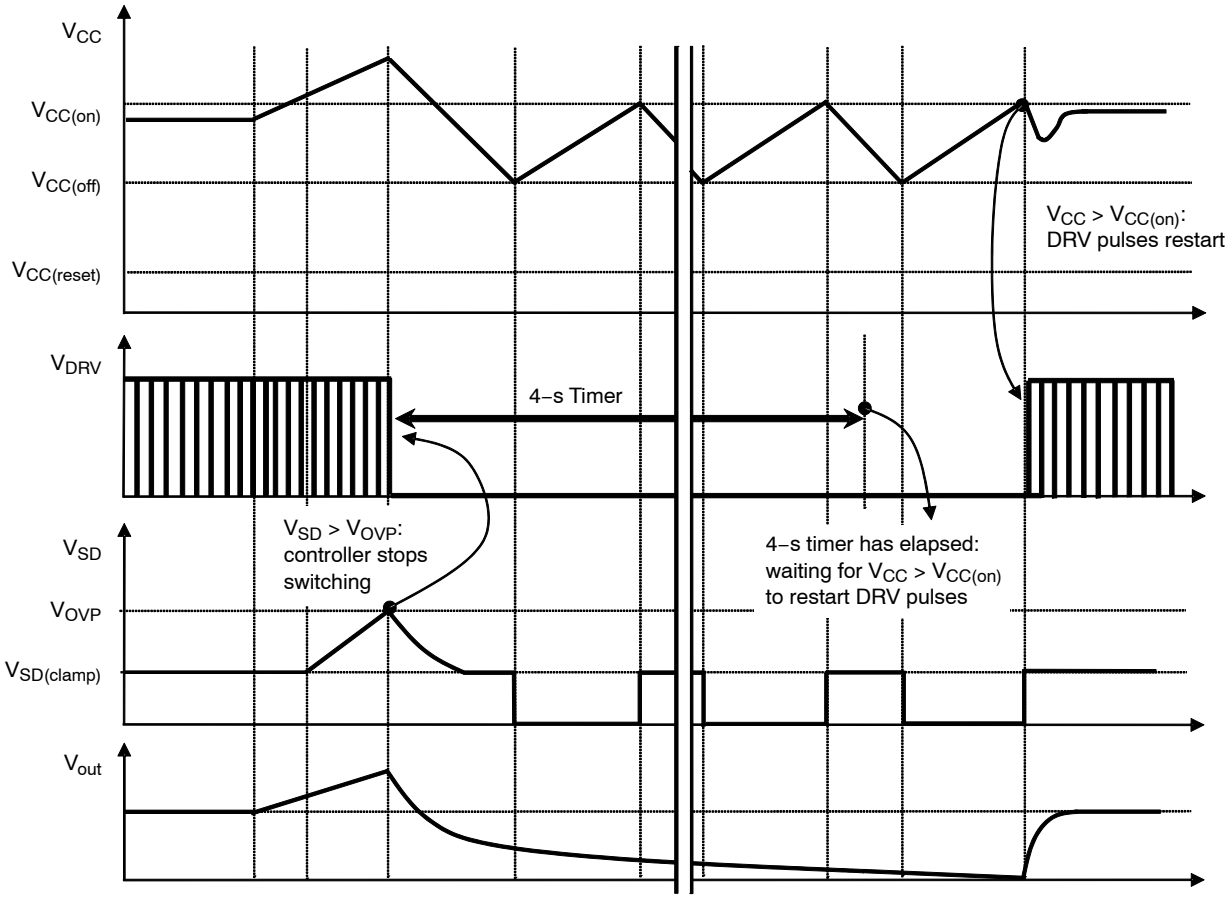

Figure 59. OVP with SD Pin Chronograms

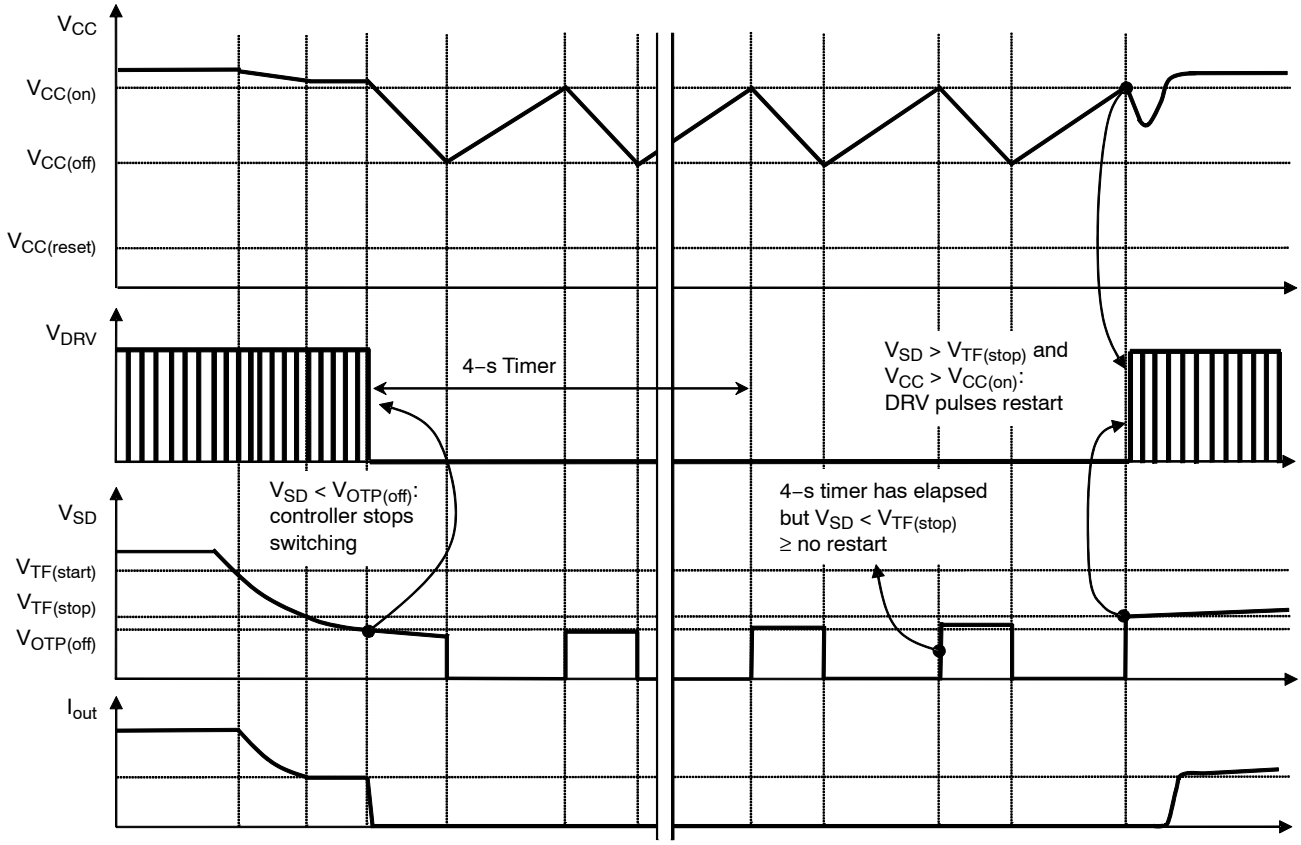

Figure 60. Thermal Fold−back / OTP Chronograms

PWM or Linear Dimming Detection

The pin DIM allows implementing either linear dimming or PWM dimming of the LED light.

If the power supply designer apply an analog signal varying from $V_{DIM(EN)}$ to V_{DIM100} to the DIM pin, the output current will increase or decrease proportionally to the voltage applied. For $V_{DIM} = V_{DIM100}$, the power supply delivers the maximum output current.

If a voltage lower than $V_{DIM(EN)}$ is applied to the DIM pin, the DRV pulses are disabled. Thus, for PWM dimming, a PWM signal with a low state value < $V_{DIM(EN)}$ and a high state value > V_{DIM100} should be applied.

The DIM pin is pulled up internally by a small current source. Thus, if the pin is left open, the controller is able to start.

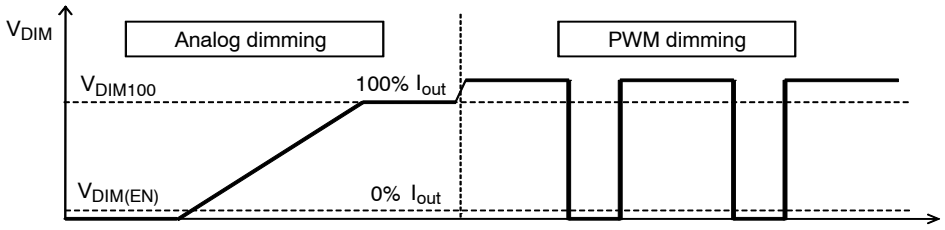

Figure 61. Pin DIM Chronograms

Note:

- If a PWM voltage with a high state value < V_{DIM100} is applied to the DIM pin, the product will still be in PWM dimming mode, but the reference voltage will be decreased according to V_{DIM}. This allows increased dynamic range on the dimming control pin.
- **Thermal Foldback and dimming:** if the IC is in a dimming state and the thermal foldback (TF) is activated, the output current is further reduced to a value equal to Dimming*TF.

V_{CC} Over Voltage Protection (Open LED Protection)

If no output load is connected to the LED power supply, the controller must be able to safely limit the output voltage excursion.

In the NCL30082, when the V_{CC} voltage reaches the $V_{CC(OVP)}$ threshold, the controller stops the DRV pulses and the 4−s timer starts counting. The IC re−start pulsing after the 4−s timer has elapsed and when $V_{CC} \geq V_{CC(on)}$.

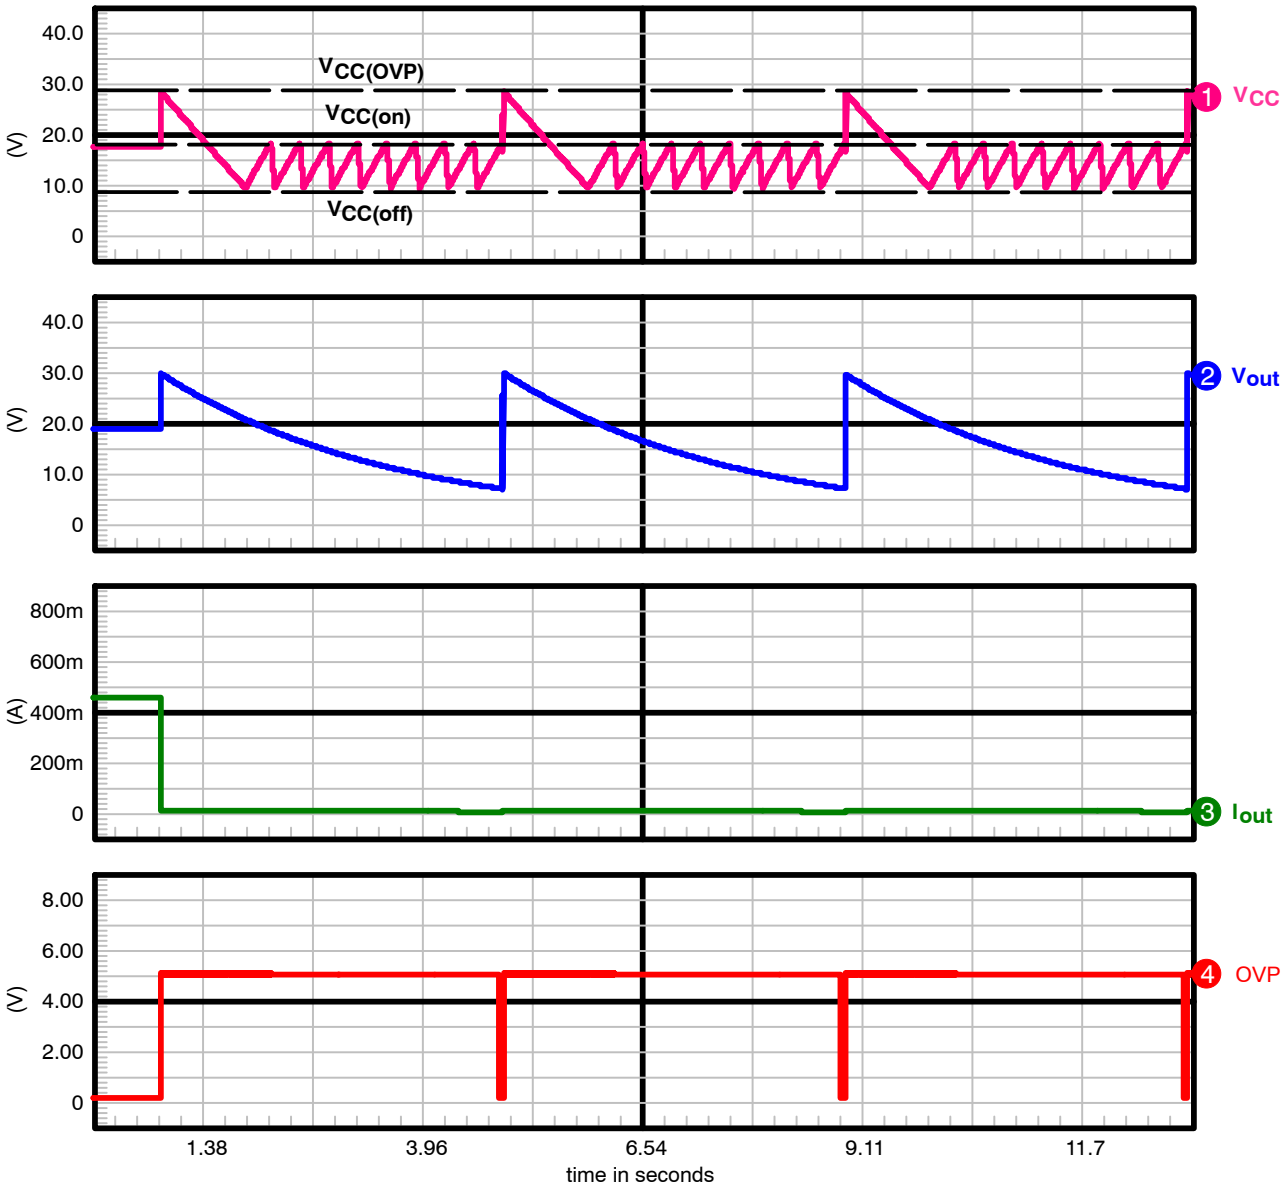

Figure 62. Open LED Protection Chronograms

Valley Lockout

Quasi−square wave resonant systems have a wide switching frequency excursion. The switching frequency increases when the output load decreases or when the input voltage increases. The switching frequency of such systems must be limited.

The NCL30082 changes the valley as the input voltage increases and as the output current set−point is varied (dimming and thermal fold−back). This limits the switching frequency excursion. Once a valley is selected, the controller stays locked in the valley until the input voltage or the output current set−point varies significantly. This avoids valley jumping and the inherent noise caused by this phenomenon.

The input voltage is sensed by the VIN pin (line range detection in Figure 63). The internal logic selects the operating valley according to VIN pin voltage, SD pin voltage and DIM pin voltage.

By default, when the output current is not dimmed, the controller operates in the first valley at low line and in the second valley at high line.

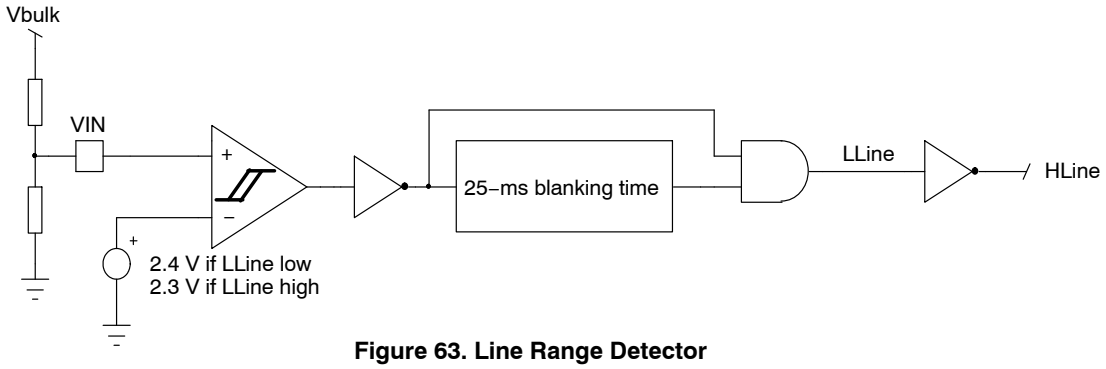

Figure 63. Line Range Detector

Table 4. VALLEY SELECTION

I_{out} value at which the controller changes valley (I_{out} decreasing)	VIN pin voltage for valley change					I_{out} value at which the controller changes valley (I_{out} increasing)
	V_{VIN} decreases ←					
	0	−LL−	2.3 V	−HL−	5 V	
100%		1st		2nd		100%

0%						0%
I_{out} decreases ↓						I_{out} increases ↑
	0	−LL−	2.4 V	−HL−	5 V	
	V_{VIN} increases →					
	VIN pin voltage for valley change					

Zero Crossing Detection Block

The ZCD pin allows detecting when the drain−source voltage of the power MOSFET reaches a valley.

A valley is detected when the voltage on pin 1 crosses below the $V_{ZCD(THD)}$ internal threshold.

At startup or in case of extremely damped free oscillations, the ZCD comparator may not be able to detect the valleys. To avoid such a situation, the NCL30082 features a Time−Out circuit that generates pulses if the voltage on ZCD pin stays below the $V_{ZCD(THD)}$ threshold for 6.5 μs.

The time−out also acts as a substitute clock for the valley detection and simulates a missing valley in case of too damped free oscillations.

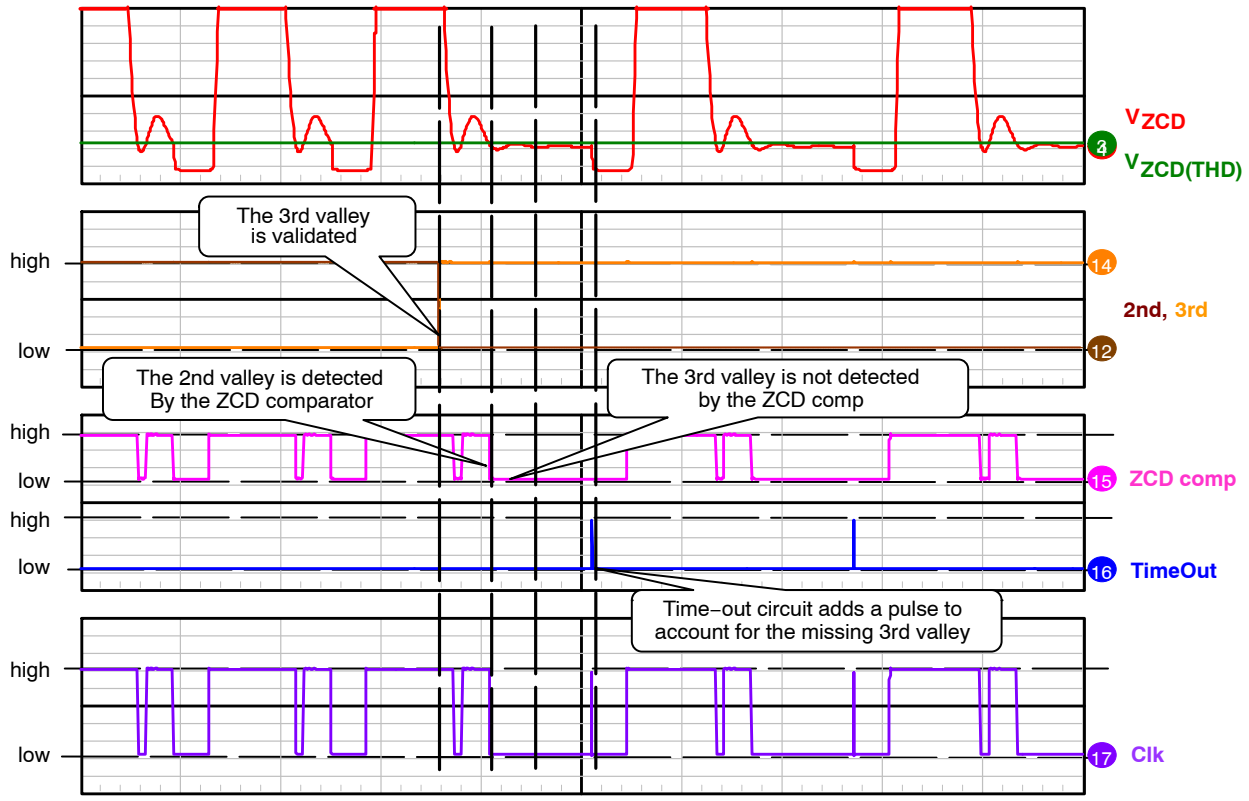

Figure 64. Time−out Chronograms

Normally with this type of time−out function, in the event the ZCD pin or the auxiliary winding is shorted, the controller could continue switching leading to improper regulation of the LED current. Moreover during an output short circuit, the controller will strive to maintain constant current operation.

To avoid these scenarios, a protection circuit consisting of a comparator and secondary timer starts counting when the ZCD voltage is below the $V_{ZCD(short)}$ threshold. If this timer reaches 90 ms, the controller detects a fault and shutdown. The auto−restart version (B, B1, B2, D suffix) waits 4 seconds, then the controller restarts switching. In the latched version (A suffix), the controller is latched as long as V_{CC} stays above the $V_{CC(reset)}$ threshold.

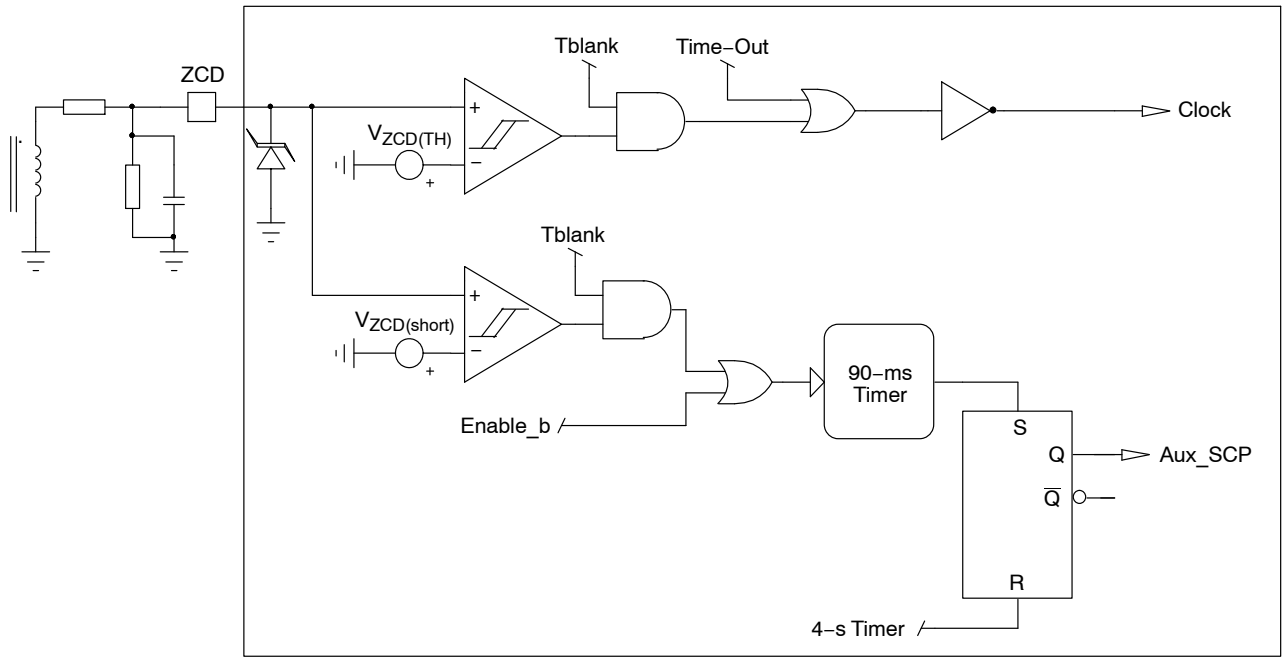

Figure 65. ZCD Block Schematic

Line Feed−Forward

Because of the propagation delays, the MOSFET is not turned−off immediately when the current set−point is reached. As a result, the primary peak current is higher than expected and the output current increases. To compensate the peak current increase brought by the propagation delay, a positive voltage proportional to the line voltage is added on the current sense signal. The amount of offset voltage can be adjusted using the R_{CS} resistor as shown in Figure 66.

$$V_{CS(offset)} = K_{LFF} V_{pinVIN} R_{CS} \quad \text{(eq. 5)}$$

The offset voltage is applied only during the MOSFET on−time.

This offset voltage is removed at light load during dimming when the output current drops below 15% of the programmed output current.

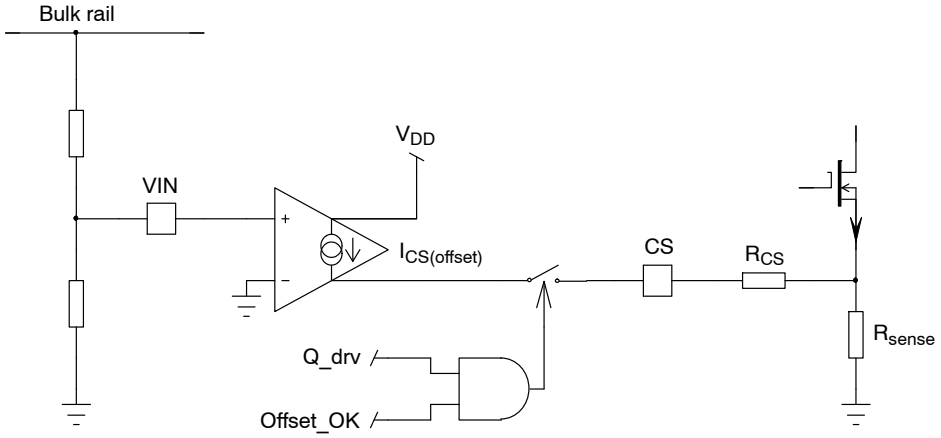

Figure 66. Line Feed−Forward Schematic

Brown−out

In order to protect the supply against a very low input voltage, the NCL30082 features a brown−out circuit with a fixed ON/OFF threshold. The controller is allowed to start if a voltage higher than 1 V is applied to the VIN pin and shuts−down if the VIN pin voltage decreases and stays below 0.9 V for 50 ms nominal. For the NCL30082D, the blanking time is reduced to 15 ms. Exiting a brown−out condition overrides the hiccup on V_{CC} (V_{CC} does not wait to reach $V_{CC(off)}$) and the IC immediately goes into startup mode ($I_{CC} = I_{CC(start)}$).

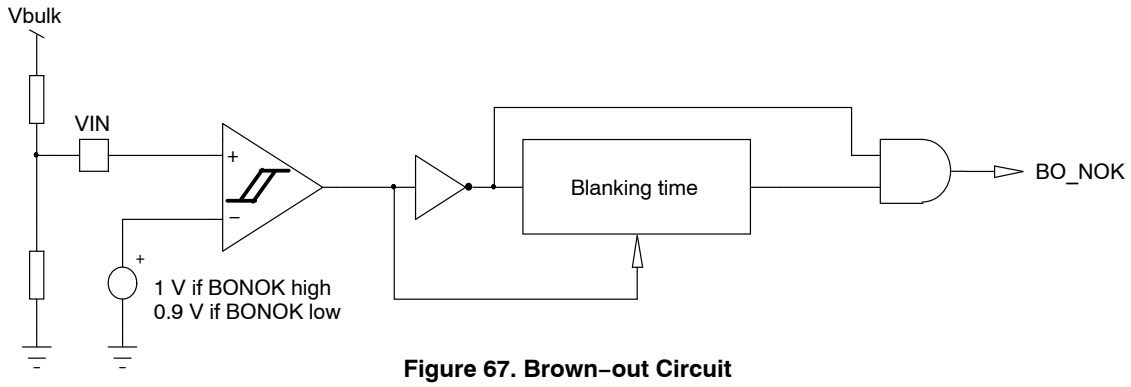

Figure 67. Brown−out Circuit

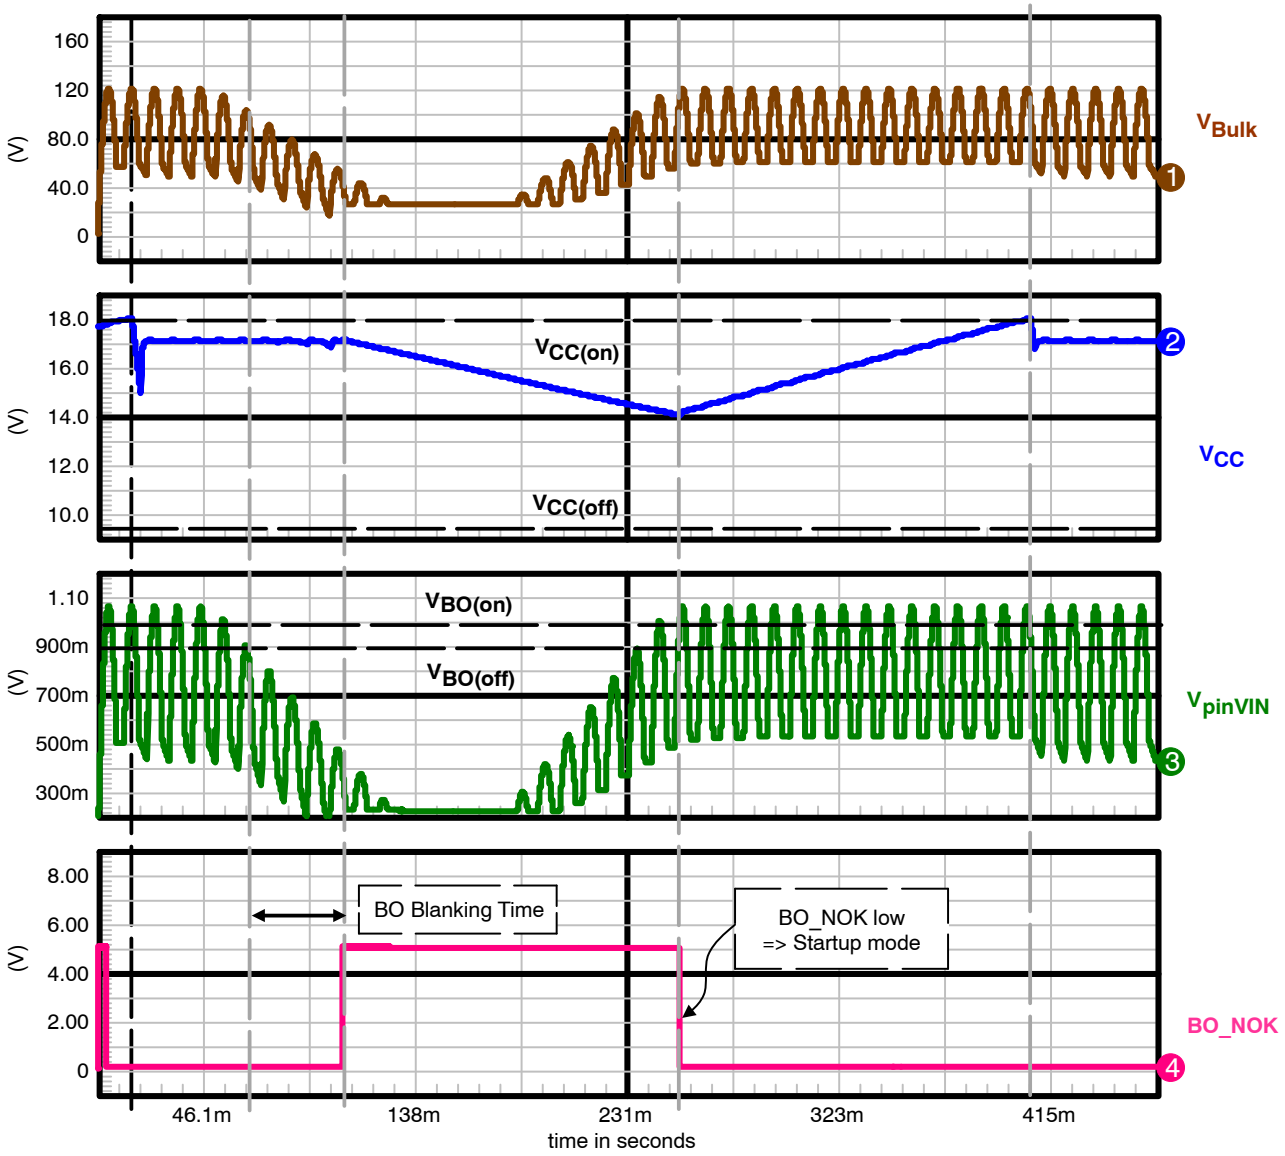

Figure 68. Brown−Out Chronograms (Valley Fill circuit is used)

CS Pin Short Circuit Protection

Normally, if the CS pin or the sense resistor is shorted to ground, the Driver will not be able to turn off, leading to potential damage of the power supply. To avoid this, the versions A, B, B1, B2, B3 and D feature a circuit to protect the power supply against a short circuit of the CS pin. When the MOSFET is on, if the CS voltage stays below VCS(low) after the adaptive blanking timer has elapsed, the controller shuts down and will attempt to restart on the next VCC hiccup. In the NCL30082B1, this protection is disabled.

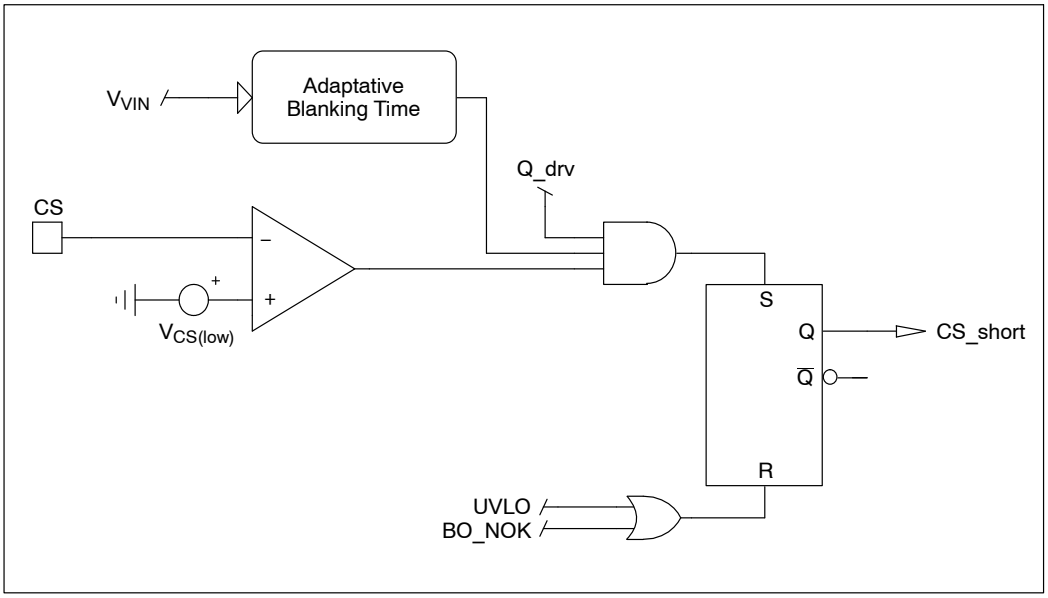

Figure 69. CS Pin Short Circuit Protection Schematic

Fault Management

OFF Mode

The circuit turns off whenever a major condition prevents it from operating:

- Incorrect feeding of the circuit: “UVLO high”. The UVLO signal becomes high when V_{CC} drops below $V_{CC(off)}$ and remains high until V_{CC} exceeds $V_{CC(on)}$.
- OTP
- V_{CC} OVP
- OVP2 (additional OVP provided by SD pin)
- Output diode short circuit protection: “WOD_SCP high”
- Output / Auxiliary winding Short circuit protection: “Aux_SCP high”
- Die over temperature (TSD)
- Brown−Out: “BO_NOK” high
- Pin CS short circuited to GND: “CS_short high”

In this mode, the DRV pulses are stopped. The VCC voltage decrease through the controller own consumption (I_{CC1}).

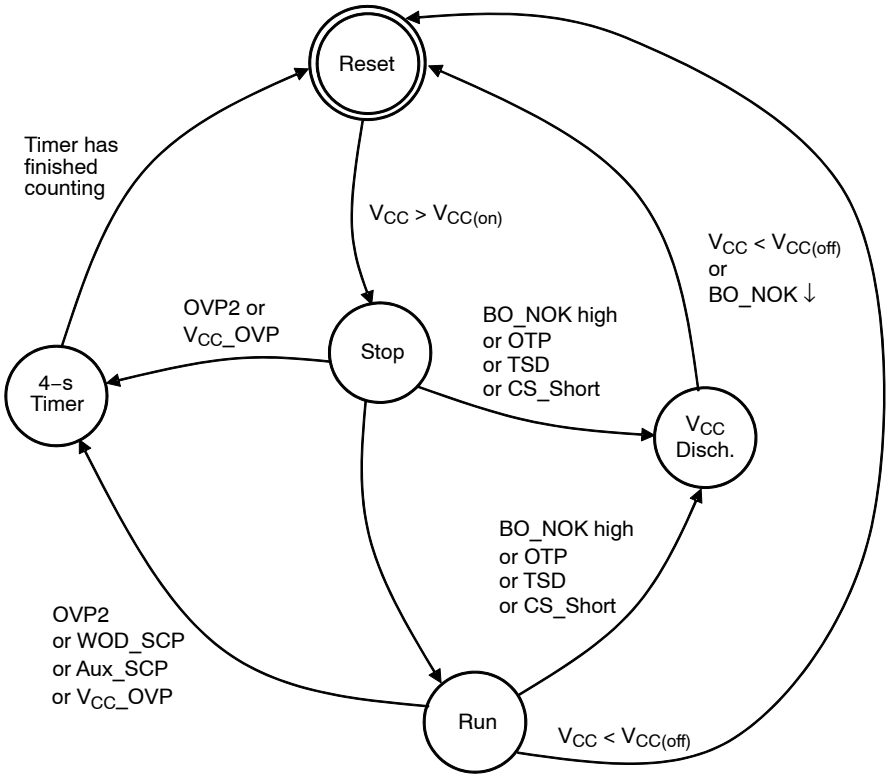
For the output diode short circuit protection, the CS pin short circuit protection, the output / aux. winding short circuit protection and the OVP2, the controller waits 4 seconds (auto−recovery timer) and then initiates a startup sequence ($V_{CC} \geq V_{CC(on)}$) before re−starting switching.

Latch Mode

This mode is activated by the output diode short−circuit protection (WOD_SCP), the OTP and the Aux−SCP in **version A only.**

In this mode, the DRV pulses are stopped and the controller is latched. There are hiccups on V_{CC}.

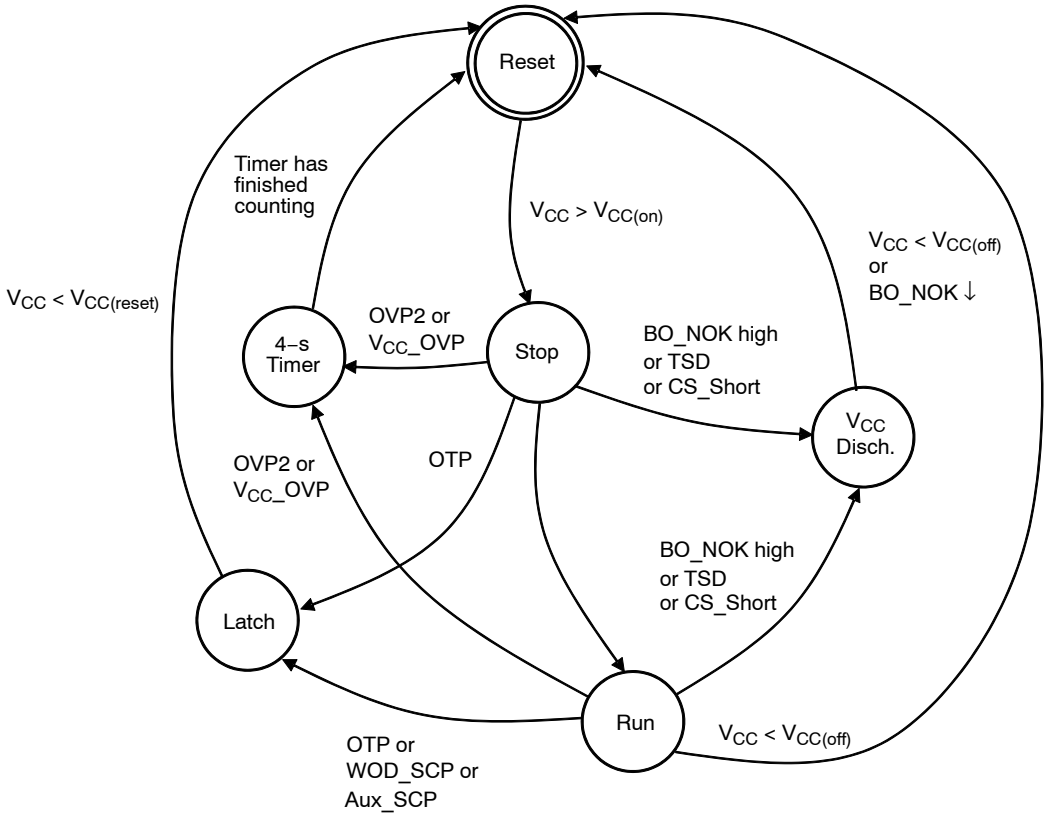
The circuit un−latches when $V_{CC} < V_{CC(reset)}$.



With states:	Reset	→	Controller is reset, $I_{CC} = I_{CC(start)}$
	Stop	→	Controller is ON, DRV is not switching, $t_{OTP(start)}$ has elapsed
	Run	→	Normal switching
	V_{CC} Disch.	→	No switching, $I_{CC} = I_{CC1}$, waiting for V_{CC} to decrease to $V_{CC(off)}$
	4−s Timer	→	the auto−recovery timer is counting, V_{CC} is ramping up and down between $V_{CC(on)}$ and $V_{CC(off)}$

Note: For the NCL30082B1, the CS pin short circuit Protection is disabled

Figure 70. State Diagram for B, B1, B2, B3 and D Version Faults



With states: Reset → Controller is reset, $I_{CC} = I_{CC(start)}$
Stop → Controller is ON, DRV is not switching, $t_{OTP(start)}$ has elapsed
Run → Normal switching
V_{CC} Disch. → No switching, $I_{CC} = I_{CC1}$, waiting for V_{CC} to decrease to $V_{CC(off)}$
4−s Timer → the auto−recovery timer is counting, V_{CC} is ramping up and down between $V_{CC(on)}$ and $V_{CC(off)}$
Latch → Controller is latched off, V_{CC} is ramping up and down between $V_{CC(on)}$ and $V_{CC(off)}$, only $V_{CC(reset)}$ can release the latch.

5. IOUT
6. IOUT
7. IOUT
8. IOUT

STYLE 26:
PIN 1. GND
2. dv/dt
3. ENABLE
4. ILIMIT
5. SOURCE
6. SOURCE
7. SOURCE
8. VCC

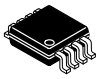
STYLE 27:
PIN 1. ILIMIT
2. OVLO
3. UVLO
4. INPUT+
5. SOURCE
6. SOURCE
7. SOURCE
8. DRAIN

STYLE 28:
PIN 1. SW_TO_GND
2. DASIC_OFF
3. DASIC_SW_DET
4. GND
5. V_MON
6. VBULK
7. VBULK
8. VIN

STYLE 29:
PIN 1. BASE, DIE #1
2. EMITTER, #1
3. BASE, #2
4. EMITTER, #2
5. COLLECTOR, #2
6. COLLECTOR, #2
7. COLLECTOR, #1
8. COLLECTOR, #1

STYLE 30:
PIN 1. DRAIN 1
2. DRAIN 1
3. GATE 2
4. SOURCE 2
5. SOURCE 1/DRAIN 2
6. SOURCE 1/DRAIN 2
7. SOURCE 1/DRAIN 2
8. GATE 1

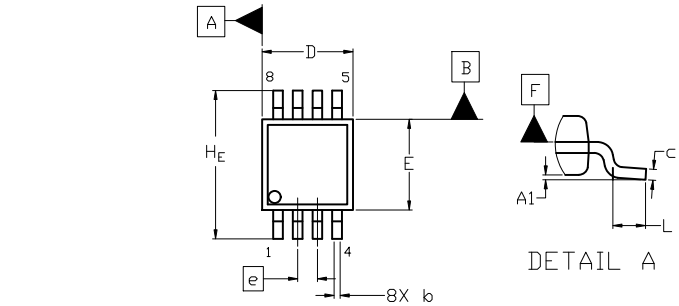
DOCUMENT NUMBER:	**98ASB42564B**	Electronic versions are uncontrolled except when accessed directly from the Document Repository. Printed versions are uncontrolled except when stamped "CONTROLLED COPY" in red.	
DESCRIPTION:	**SOIC−8 NB**		**PAGE 2 OF 2**

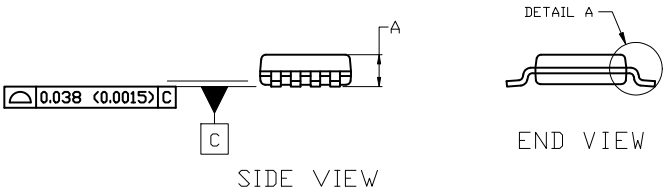


SCALE 2:1

Micro8
CASE 846A–02
ISSUE K

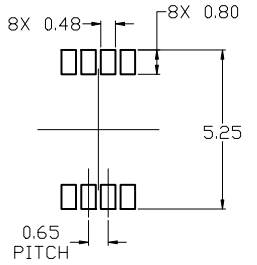
DATE 16 JUL 2020





NOTES:

1. DIMENSIONING AND TOLERANCING PER ASME Y14.5M, 2009.
2. CONTROLLING DIMENSION: MILLIMETERS
3. DIMENSION b DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE PROTRUSION SHALL BE 0.10 mm IN EXCESS OF MAXIMUM MATERIAL CONDITION.
4. DIMENSIONS D AND E DO NOT INCLUDE MOLD FLASH, PROTRUSION OR GATE BURRS. MOLD FLASH, PROTRUSIONS, OR GATE BURRS SHALL NOT EXCEED 0.15 mm PER SIDE. DIMENSION E DOES NOT INCLUDE INTERLEAD FLASH OR PROTRUSION. INTERLEAD FLASH OR PROTRUSION SHALL NOT EXCEED 0.25 mm PER SIDE. DIMENSIONS D AND E ARE DETERMINED AT DATUM F.
5. DATUMS A AND B ARE TO BE DETERMINED AT DATUM F.
6. A1 IS DEFINED AS THE VERTICAL DISTANCE FROM THE SEATING PLANE TO THE LOWEST POINT ON THE PACKAGE BODY.

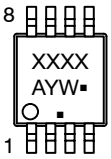


RECOMMENDED
MOUNTING FOOTPRINT

For additional information on our Pb-Free strategy and soldering details, please download the ON Semiconductor Soldering and Mounting Techniques Reference Manual, SOLDERRM/D.

DIM	MILLIMETERS		
	MIN.	NOM.	MAX.
A	---	---	1.10
A1	0.05	0.08	0.15
b	0.25	0.33	0.40
c	0.13	0.18	0.23
D	2.90	3.00	3.10
E	2.90	3.00	3.10
e	0.65 BSC		
H_E	4.75	4.90	5.05
L	0.40	0.55	0.70

GENERIC MARKING DIAGRAM*



XXXX = Specific Device Code
A = Assembly Location
Y = Year
W = Work Week
▪ = Pb–Free Package

(Note: Microdot may be in either location)

*This information is generic. Please refer to device data sheet for actual part marking. Pb–Free indicator, “G” or microdot “▪”, may or may not be present. Some products may not follow the Generic Marking.
