

# NCV8445

## Self Protected High Side Driver with Temperature Shutdown and Current Limit

The NCV8445 is a fully protected High-Side driver that can be used to switch a wide variety of loads, such as bulbs, solenoids and other actuators. The device is internally protected from an overload condition by an active current limit and thermal shutdown.

A diagnostic output reports ON and OFF state open load conditions as well as thermal shutdown.

### Features

- Short Circuit Protection
- Thermal Shutdown with Automatic Restart
- CMOS (3.3 V / 5 V) compatible control input
- Open Load Detection in On and Off State
- Diagnostic Output
- Undervoltage and Overvoltage Shutdown
- Loss of Ground Protection
- ESD protection
- Slew Rate Control for Low EMI Switching
- Very Low Standby Current
- NCV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC-Q100 Qualified and PPAP Capable
- These Devices are Pb-Free and are RoHS Compliant

### Typical Applications

- Switch a Variety of Resistive, Inductive and Capacitive Loads
- Can Replace Electromechanical Relays and Discrete Circuits
- Automotive / Industrial

ON Semiconductor®

## PIN DESCRIPTION

Pin #	Symbol	Description
1	GND	Ground
2	IN	Logic Level Input
3	STAT	Status Output
4	N/C	No Connection
5	V <sub>D</sub>	Supply Voltage
6	OUT	Output
7	OUT	Output
8	V <sub>D</sub>	Supply Voltage

# MAXIMUM RATINGS

Rating	Symbol	Value		Unit
		Min	Max	
DC Supply Voltage	$V_D$	-0.3	42	V
Peak Transient Input Voltage (Load Dump 42.5 V, $V_D = 13.5$ V, $R_{LOAD} = 6.5$ $\Omega$ , ISO7637-2 pulse 5)	$V_{peak}$		56	V
Input Voltage	$V_{in}$	-8	8	V
Input Current	$I_{in}$	-5	5	mA
Output Current (Note 1)	$I_{out}$	-6	Internally Limited	A
Negative Ground Current	$-I_{gnd}$	-200	-	mA
Status Current	$I_{status}$	-5	5	mA
Power Dissipation, $T_A = 25^\circ\text{C}$	$P_{tot}$	1.183		W
Electrostatic Discharge (HBM Model 100 pF / 1500 $\Omega$ )				DC
Input		4		kV
Status		3.5		kV
Output		5		kV
$V_D$		5		kV
Single Pulse Inductive Load Switching Energy (Note 2) ( $L = 1.8$ mH, $V_{bat} = 13.5$ V; $I_L = 8.75$ A, $T_{Jstart} = 150^\circ\text{C}$ )	$E_{AS}$	101.5		mJ
Operating Junction Temperature	$T_J$	-40	+150	$^\circ\text{C}$
Storage Temperature	$T_{storage}$	-55	+150	$^\circ\text{C}$

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

- Reverse Output current has to be limited by the load to stay within absolute maximum ratings and thermal performance.
- Not subjected to production testing.

# THERMAL RESISTANCE RATINGS

Parameter	Symbol	Max Value	Unit
Thermal Resistance Junction-to-Lead	$R_{\theta JL}$	30	$^\circ\text{C/W}$
Junction-to-Ambient (min. Pad)	$R_{\theta JA}$	110.8	$^\circ\text{C/W}$
Junction-to-Ambient (1" square pad size, FR-4, 1 oz Cu)	$R_{\theta JA}$	105.6	$^\circ\text{C/W}$

**ELECTRICAL CHARACTERISTICS** ( $8 \leq V_D \leq 36$  V;  $-40^\circ\text{C} < T_J < 150^\circ\text{C}$  unless otherwise specified)

Rating	Symbol	Conditions	Value			Unit

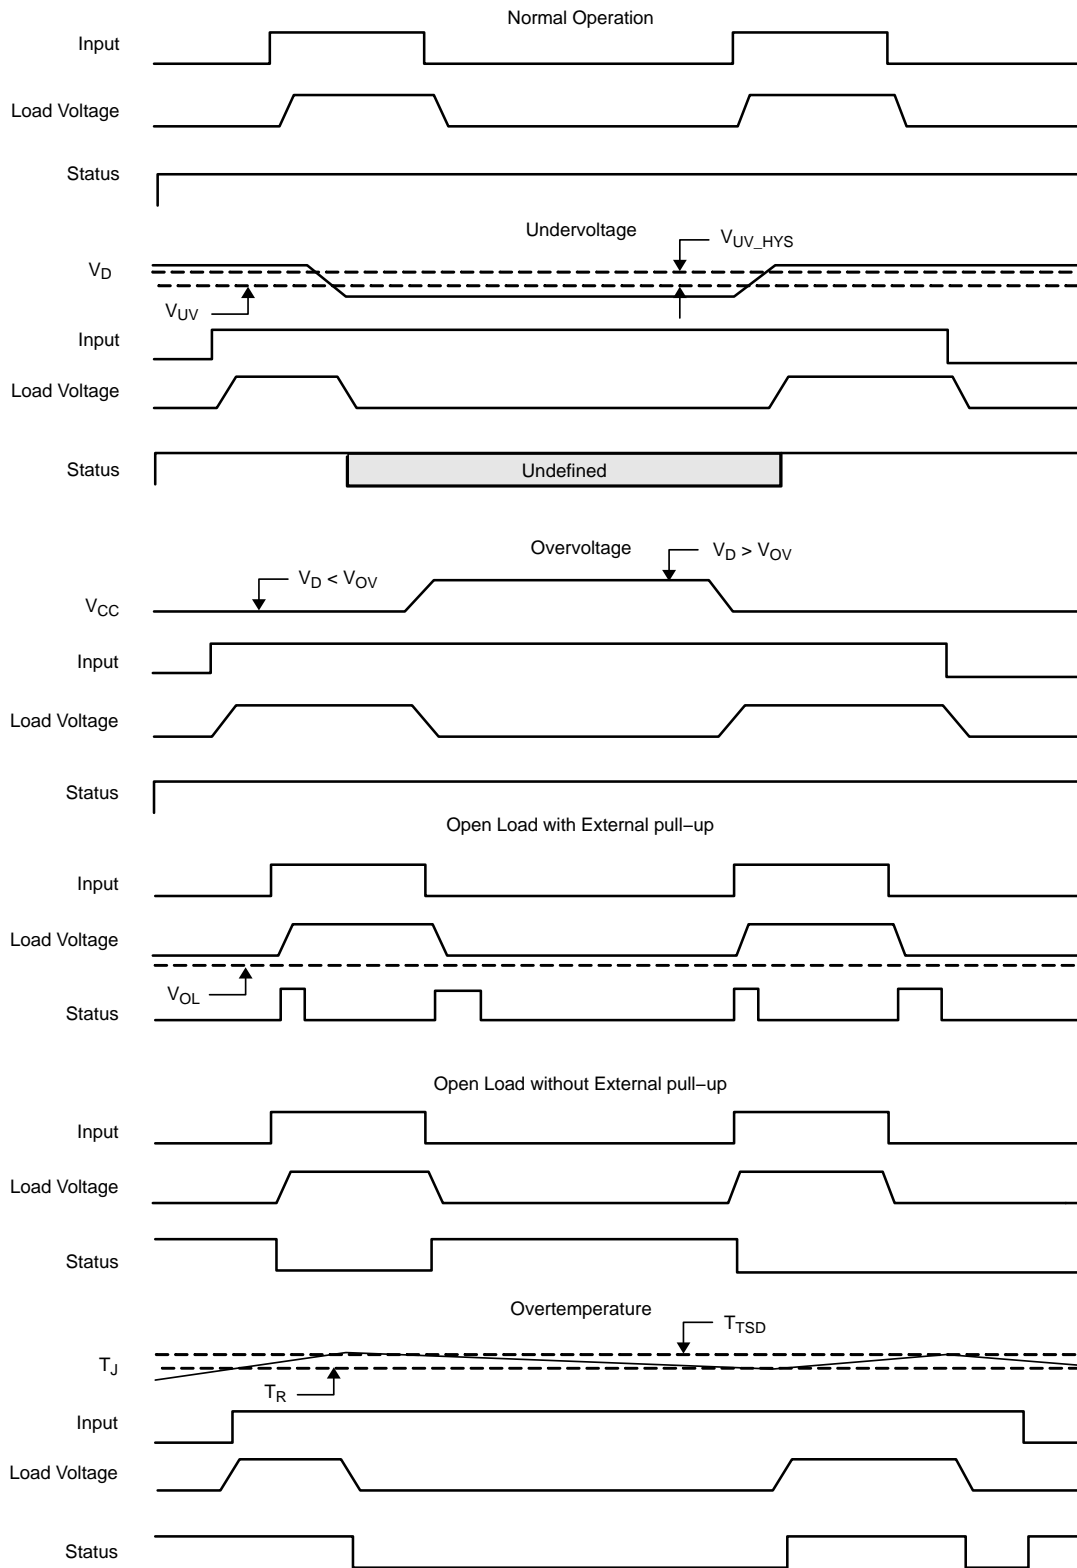

Figure 30. Waveforms

Figure 31. Application Diagram

#### Reverse Battery Protection

An external resistor  $R_{GND}$  is required to adequately protect the device from a Reverse Battery event. The resistor value can be calculated using the following two formulas.

1.  $R_{GND} \geq 600 \text{ mV} / (I_d \text{ (on) max})$
2.  $R_{GND} \geq (-V_D) / (-I_{gnd})$

Maximum  $(-I_{gnd})$  current, which is the reverse GND pin current, can be found in the Maximum Ratings section. Several High Side Devices can share same the reverse battery protection resistor. Please note that the sum of  $(I_d \text{ (on) max})$  of all devices should be used to calculate  $R_{GND}$  value. If the microprocessor ground is not common with the device ground,  $R_{GND}$  will produce a voltage offset  $((I_d \text{ (on) max}) \times R_{GND})$  with respect to the IN and STAT pins.

This offset will be increased when more than one device shares the resistor.

Power Dissipation during a reverse battery event is equal to:

$$P_D = (-V_D)^2 / R_{GND}$$

In the case of high power dissipation due to several devices sharing  $R_{GND}$ , it is recommended to place a diode  $D_{GND}$  in the ground path as an alternate reverse battery protection method. When driving an inductive load, a 1 k $\Omega$  resistor should be placed in parallel with the  $D_{GND}$  diode. This method will also produce a voltage offset of ~600 mV with respect to the IN and STAT pins. This diode can also be shared amongst several High Side Devices. This voltage offset will vary if  $D_{GND}$  is shared by multiple devices.

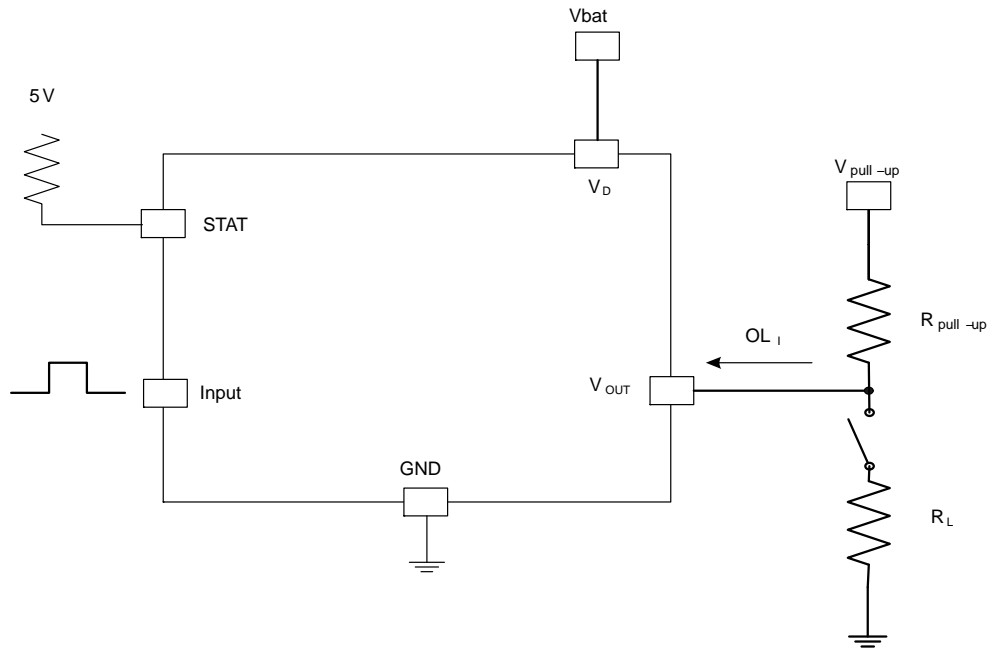

Figure 32. Open Load Detection In Off State

#### OFF State Open Load Detection

Off State Open Load Detection requires an external pull-up resistor ( $R_{\text{pull-up}}$ ) connected between  $V_{\text{OUT}}$  pin and a positive supply voltage ( $V_{\text{pull-up}}$ ).

The external  $R_{\text{pull-up}}$  resistor value should be selected to ensure that a false OFF State OL condition is not detected when the load ( $R_L$ ) is connected. A  $V_{\text{OUT}}$  voltage above the  $V_{\text{OL\_min}}$  (Openload Off State Detection Threshold) minimum value with the load ( $R_L$ ) connected needs to be avoided. The following formula shows this relationship:

$$V_{\text{OUT}} = \left( V_{\text{pull-up}} / (R_L + R_{\text{pull-up}}) \right) R_L < V_{\text{OL\_min}}$$

In addition to ensuring the selected  $R_{\text{pull-up}}$  resistor value does not cause a false OFF State OL detection condition

when the load is connected, the  $R_{\text{pull-up}}$  must also not cause the OFF State OL to miss detecting an OL condition when the load is disconnected. A  $V_{\text{OUT}}$  voltage below the  $V_{\text{OL\_max}}$  (Openload Off State Detection Threshold) maximum value with the load ( $R_L$ ) disconnected needs to be avoided. The following formula shows this relationship:

$$R_{\text{pull-up}} < (V_{\text{pull-up}} - V_{\text{OL\_max}}) / OL_1$$

$$OL_1 = I_L (\text{Output Leakage with } V_{\text{OUT}} = 3.5 \text{ V})$$

Because  $I_d$  (OFF) may significantly increase if  $V_{\text{OUT}}$  is pulled high (up to several mA),  $R_{\text{pull-up}}$  resistor should be connected to a supply that is switched OFF when the module is in standby.

**onsemi** and **onsemi** are trademarks of Semiconductor Components Industries, LLC dba **onsemi** or its subsidiaries in the United States and/or other countries. **onsemi** reserves the right to make changes without further notice to any products herein. **onsemi** makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does **onsemi** assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. **onsemi** does not convey any license under its patent rights nor the rights of others.

**onsemi**, **Onsemi**, and other names, marks, and brands are registered and/or common law trademarks of Semiconductor Components Industries, LLC dba "**onsemi**" or its affiliates and/or subsidiaries in the United States and/or other countries. **onsemi** owns the rights to a number of patents, trademarks, copyrights, trade secrets, and other intellectual property. A listing of **onsemi**'s product/patent coverage may be accessed at [www.onsemi.com/site/pdf/Patent-Marking.pdf](http://www.onsemi.com/site/pdf/Patent-Marking.pdf). **onsemi** reserves the right to make changes at any time to any products or information herein, without notice. The information herein is provided "as-is" and **onsemi** makes no warranty, representation or guarantee regarding the accuracy of the information, product features, availability, functionality, or suitability of its products for any particular purpose, nor does **onsemi** assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. Buyer is responsible for its products and applications using **onsemi** products, including compliance with all laws, regulations and safety requirements or standards, regardless of any support or applications information provided by **onsemi**. "Typical" parameters which may be provided in **onsemi** data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. **onsemi** does not convey any license under any of its intellectual property rights nor the rights of others. **onsemi** products are not designed, intended, or authorized for use as a critical component in life support systems or any FDA Class 3 medical devices or medical devices with a same or similar classification in a foreign jurisdiction or any devices intended for implantation in the human body. Should Buyer purchase or use **onsemi** products for any such unintended or unauthorized application, Buyer shall indemnify and hold **onsemi** and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that **onsemi** was negligent regarding the design or manufacture of the part. **onsemi** is an Equal Opportunity/Affirmative Action Employer. This literature is subject to all applicable copyright laws and is not for resale in any manner.
