ESD Protection Diode

Low Capacitance Surface Mount ESD Protection for High-Speed Data Interfaces

SRDA3.3-4

The SRDA3.3-4 surge protection is designed to protect equipment attached to high speed communication lines from ESD and lightning.

Features

- Protects 4 I/O Lines
- Low Working Voltage: 3.3 V
- Low Clamping Voltage
- Low Capacitance (<15 pF) for High Speed Interfaces
- Peak Power - 500 W 8x20 μs
- Transient Protection for High Speed Lines to:
  IEC61000-4-2 (ESD) ±15 kV (air), ±8 kV (contact)
  IEC61000-4-4 (EFT) 40 A
  IEC61000-4-5 (Lightning) 25 A
- UL Flammability Rating of 94 V−0
- This is a Pb-Free Device

Typical Applications

- High Speed Communication Line Protection
- T1/E1 Secondary Protection
- T3/E3 Secondary Protection
- Analog Video Protection
- Base Stations
- I^2C Bus Protection

MAXIMUM RATINGS

Rating	Symbol	Value	Unit
Peak Power Dissipation 8 x 20 μS @ T_A = 25 °C (Note 1)	P_{pk}	500	W
Junction and Storage Temperature Range	T_J, T_{stg}	−55 to +150	°C
Lead Solder Temperature – Maximum 10 Seconds Duration	T_L	260	°C
IEC 61000-4-2 Contact Air	ESD	±8 ±15	kV
IEC 61000-4-4 (5/50 ns)	EFT	40	A
IEC 61000-4-5 (8 x 20 μs)	–	25	A

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

APPLICATIONS INFORMATION

The SRDA3.3-4 is a low capacitance surge protection diode array designed to protect sensitive electronics such as communications systems, computers, and computer peripherals against damage due to ESD events or transient overvoltage conditions. Because of its low capacitance, it can be used in high speed I/O data lines. The integrated design of the SRDA3.3-4 offers surge rated, low capacitance steering diodes and a surge protection diode integrated in a single package (SO-8). If a transient condition occurs, the steering diodes will drive the transient to the positive rail of the power supply or to ground. The surge protection device protects the power line against overvoltage conditions avoiding damage to the power supply and other downstream components.

SRDA3.3-4 CONFIGURATION OPTIONS

The SRDA3.3-4 is able to protect up to four data lines against transient overvoltage conditions by driving them to a fixed reference point for clamping purposes. The steering diodes will be forward biased whenever the voltage on the protected line exceeds the reference voltage (Vf or V_{CC} + Vf). The diodes will force the transient current to bypass the sensitive circuit.

Data lines are connected at pins 1, 4, 6 and 7. The negative reference is connected at pins 5 and 8. These pins must be connected directly to ground using a ground plane to minimize the PCB's ground inductance. It is very important to reduce the PCB trace lengths as much as possible to minimize parasitic inductances.

OPTION 1

Protection of four data lines and the power supply using V_{CC} as reference.

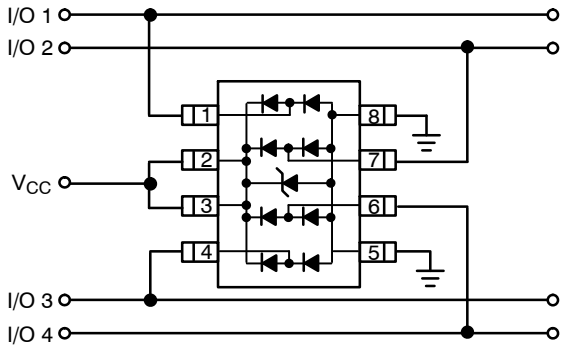

Figure 3.

For this configuration, connect pins 2 and 3 directly to the positive supply rail (V_{CC}). The data lines are referenced to the supply voltage. The internal surge protection diode prevents overvoltage on the supply rail. Biasing of the steering diodes reduces their capacitance.

OPTION 2

Protection of four data lines with bias and power supply isolation resistor.

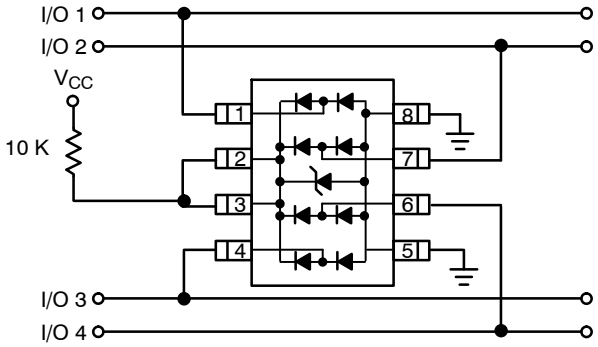

Figure 4.

The SRDA3.3-4 can be isolated from the power supply by connecting a series resistor between pins 2 and 3 and V_{CC}. A 10 kΩ resistor is recommended for this application. This will maintain a bias on the internal surge protection and steering diodes, reducing their capacitance.

OPTION 3

Protection of four data lines using the internal surge protection diode as reference.

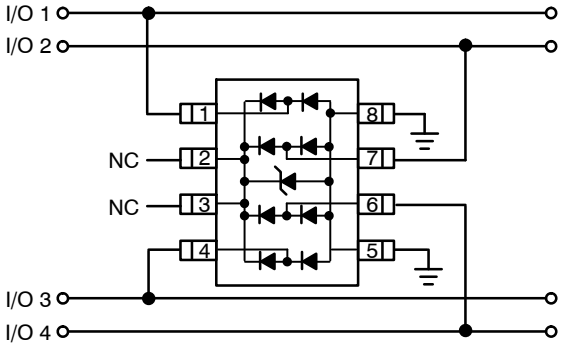

Figure 5.

In applications lacking a positive supply reference or those cases in which a fully isolated power supply is required, the internal surge protection can be used as the reference. For these applications, pins 2 and 3 are not connected. In this configuration, the steering diodes will conduct whenever the voltage on the protected line exceeds the working voltage of the surge protection plus one diode drop (Vc=Vf + V_{RWM}).

ESD PROTECTION OF POWER SUPPLY LINES

When using diodes for data line protection, referencing to a supply rail provides advantages. Biasing the diodes reduces their capacitance and minimizes signal distortion. Implementing this topology with discrete devices does have disadvantages. This configuration is shown below:

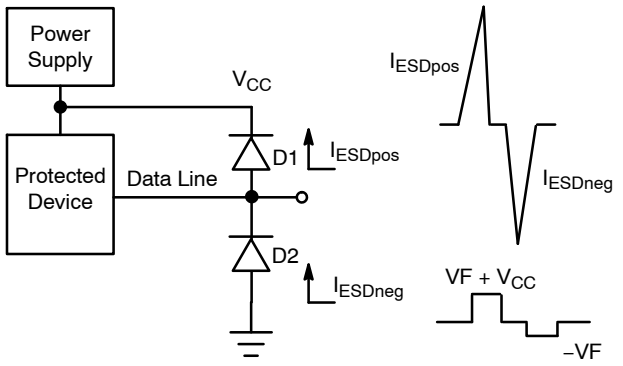

Figure 6.

Looking at the figure above, it can be seen that when a positive ESD condition occurs, diode D1 will be forward biased while diode D2 will be forward biased when a negative ESD condition occurs. For slower transient conditions, this system may be approximated as follows:

For positive pulse conditions:

$Vc = V_{CC} + Vf_{D1}$

For negative pulse conditions:

$Vc = -Vf_{D2}$

ESD events can have rise times on the order of some number of nanoseconds. Under these conditions, the effect of parasitic inductance must be considered. A pictorial representation of this is shown below.

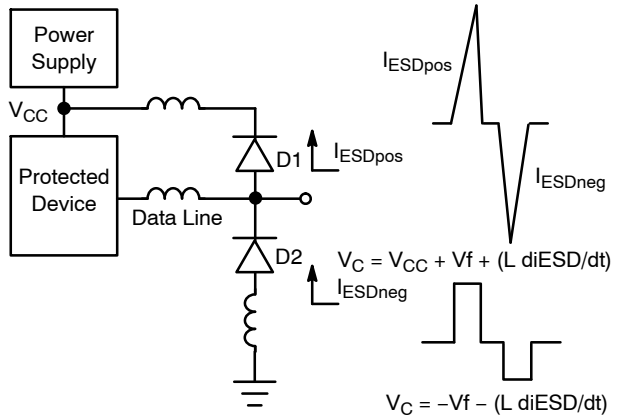

Figure 7.

An approximation of the clamping voltage for these fast transients would be:

For positive pulse conditions:

$Vc = V_{CC} + Vf + (L\ di_{ESD}/dt)$

For negative pulse conditions:

$Vc = -Vf - (L\ di_{ESD}/dt)$

As shown in the formulas, the clamping voltage (Vc) not only depends on the Vf of the steering diodes but also on the L di_{ESD}/dt factor. A relatively small trace inductance can result in hundreds of volts appearing on the supply rail. This endangers both the power supply and anything attached to that rail. This highlights the importance of good board layout. Taking care to minimize the effects of parasitic inductance will provide significant benefits in transient immunity.

Even with good board layout, some disadvantages are still present when discrete diodes are used to suppress ESD events across datalines and the supply rail. Discrete diodes with good transient power capability will have larger die and therefore higher capacitance. This capacitance becomes problematic as transmission frequencies increase. Reducing capacitance generally requires reducing die size. These small die will have higher forward voltage characteristics at typical ESD transient current levels. This voltage combined with the smaller die can result in device failure.

The **onsemi** SRDA3.3-4 was developed to overcome the disadvantages encountered when using discrete diodes for ESD protection. This device integrates a surge protection diode within a network of steering diodes.

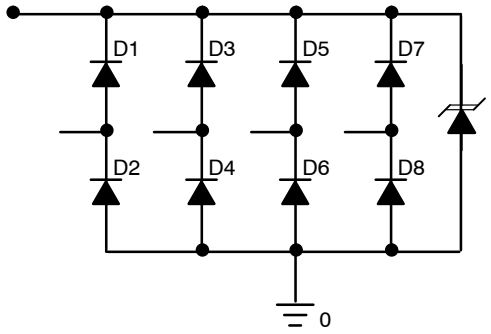

Figure 8. SRDA3.3-4 Equivalent Circuit

During an ESD condition, the ESD current will be driven to ground through the surge protection diode as shown below.

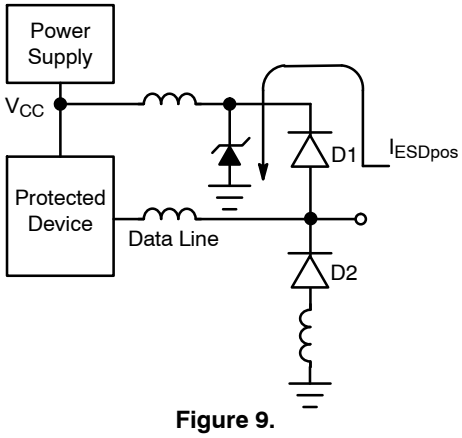

Figure 9.

The resulting clamping voltage on the protected IC will be: $Vc = V_{FD1} + V_{RWM}$.

The clamping voltage of the surge protection diode is provided in Figure 2 and depends on the magnitude of the ESD current. The steering diodes are fast switching devices with unique forward voltage and low capacitance characteristics.
