

Octal Buffer/Line Driver with 3-STATE Outputs

74VHCT245A

TSSOP20, 4.4x6.5
CASE 948AQ

General Description

The VHCT245A is an advanced high speed CMOS octal bus transceiver fabricated with silicon gate CMOS technology. It achieves high speed operation similar to equivalent Bipolar Schottky TTL while maintaining the CMOS low power dissipation. The VHCT245A is intended for bidirectional asynchronous communication between data busses. The direction of data transmission is determined by the level of the T/R input. The enable input can be used to disable the device so that the busses are effectively isolated.

Protection circuits ensure that 0 V to 5.5 V can be applied to the input and output⁽¹⁾ pins without regard to the supply voltage. These circuits prevent device destruction due to mismatched supply and input/output voltages. This device can be used to interface 5 V to 3 V systems and two supply systems such as battery back up.

NOTE:

1. Outputs in OFF-State

8. C_{PD} is defined as the value of the internal equivalent capacitance which is calculated from the operating current consumption without load. Average operating current can be obtained by the equation: I_{CC} (Opr.) = C_{PD} · V_{CC} · f_{IN} + I_{CC} / 8 (per F/F). The total C_{PD} when n pcs. of the Octal D Flip-Flop operates can be calculated by the equation: C_{PD} (total) = 20 + 12n
