Common Mode Filter with ESD Protection

Functional Description

The EMI813x is a family of Common Mode Filters (CMF) with integrated ESD protection, a first in the industry. Differential signaling I/Os can now have both common mode filtering and ESD protection in one package. The EMI813x protects against ESD pulses up to ± 15 kV contact per the IEC61000-4-2 standard.

The EMI813x is well-suited for protecting systems using high-speed differential ports such as MIPI D-PHY; corresponding ports in removable storage, and other applications where ESD protection are required in a small footprint package.

The EMI813x is available in a RoHS-compliant, XDFN-10 for 2 Differential Pair and XDFN-16 package for 3 Differential Pair.

2. These measurements performed with no external capacitor.
3. TVS devices are normally selected according to the working peak reverse voltage (V_{RWM}), which should be equal to or greater than the DC or continuous peak operating voltage level.
4. V_{BR} is measured at pulse test current I_T .

TRANSMISSION LINE PULSE (TLP) MEASUREMENTS

Transmission Line Pulse (TLP) provides current versus voltage (I-V) curves in which each data point is obtained from a 100 ns long rectangular pulse from a charged transmission line. A simplified schematic of a typical TLP system is shown in Figure 5. TLP I-V curves of ESD protection devices accurately demonstrate the product's ESD capability because the 10 s of amps current levels and under 100 ns time scale match those of an ESD event. This is illustrated in Figure 6 where an 8 kV IEC61000-4-2 current waveform is compared with TLP current pulses at 8 A and 16 A. A TLP curve shows the voltage at which the device turns on as well as how well the device clamps voltage over a range of current levels. Typical TLP I-V curves for the EMI813x are shown in Figure 5.
