

Synchronous Regulator, TINYBOOST®, 2.5 MHz

FAN48695

Description

The FAN48695 is a low-power boost regulator designed to provide a regulated output voltage from a single cell Lithium or Li-Ion battery. The device maintains output voltage regulation within the recommended operating conditions. The combination of built-in power transistors, synchronous rectification and low supply current make the FAN48695 ideal for battery-powered applications.

The FAN48695 is available in a 9-bump, 0.4 mm pitch, Wafer-Level Chip Scale Package (WLCSP).

Features

- Input Voltage Range: 2.5 V to 5.5 V
- 1 A Load Capability
- PFM / PWM for high efficiency
- 2.5 MHz Fixed Frequency PWM Operation
- Synchronous Rectification
- Reverse Current Blocking
- Automatic Pass-Through Operation
- Forced Pass-Through Mode
- Over Temperature Protection
- Over Current Protection
- Under Voltage Protection
- 3 Stage Soft Start
- These Devices are Pb-Free and are RoHS Compliant

Applications

- NFC/USB/Power Amp
- Cell Phones, Smart Phones, Portable Instruments

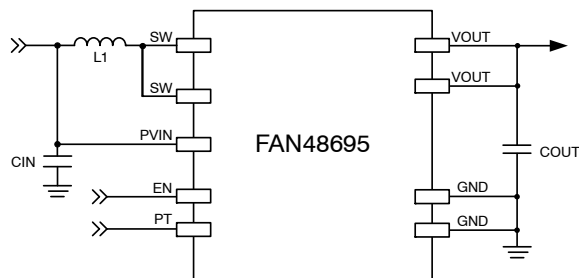

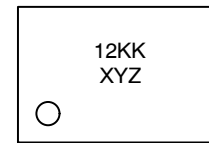

Figure 1. Typical Application

*Additional Output voltage options are available upon request.

NOTE: For improved ripple performance, additional output capacitance can be added.

Pin Configuration

Top View

Figure 3. WLCSP

Table 2. PIN DEFINITIONS

Pin	Name	Description
A1	VOUT	Output Voltage: Output of Boost Regulator. Connect C_{OUT} to this pin using the lowest impedance trace possible.
A2		
A3	PVIN	Input Voltage: Input power source for Boost Regulator. Connect C_{IN} directly to this pin using the lowest impedance trace possible.
B1	SW	Switching Node: Connect $L1$ to this pin.
B2		
B3	EN	Enable: A logic HIGH enables the device. A logic LOW disables the device.
C1	GND	Ground: Power and signal ground reference for the IC. C_{IN} and C_{OUT} should be connected to this pin using the lowest impedance trace possible.
C2		
C3	PT	Pass-Through: A logic HIGH will place the device in Forced Pass-Through mode.

Table 3. MAXIMUM RATINGS

Symbol	Parameter	Conditions	Min	Max	Units
V _{IN}	Input Voltage	PVIN pin	−0.3	6.0	V
V _{OUT}	Output Voltage	VOOUT pin	−0.3	6.0	V
V _{SW}	Continuous Switch Node Voltage	SW pin	−0.3	6.5	V
V _{CTRL}	Control Voltage	EN and PT pins	−0.3	(Note 1)	V
ESD	Electrostatic Discharge Protection Level	Human Body Model	2.0		kV
		Charged Device Model	1.0		kV
T _J	Junction Temperature		−40	+150	°C
T _{STG}	Storage Temperature		−65	+150	°C
T _L	Soldering Temperature (10 Seconds)			+260	°C

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. Lesser of 6 V or V_{IN} + 0.3 V.

Table 4. RECOMMENDED OPERATING CONDITIONS

Symbol	Parameter	Conditions	Min	Typ	Max	Units
V _{IN}	Supply Voltage Range	PV _{IN}	2.5		5.5	V
L	Inductor			1.0		μH
C _{IN}	Input Capacitance			10		μF
C _{OUT}	Output Capacitance (Note 2)		3.5	22		μF
I _{OUT}	Output Current (Note 3)	PV _{IN} ≥ 2.8 V	1000			mA
T _A	Operating Ambient Temperature		−40		+85	°C
T _J	Junction Temperature		−40		+125	°C

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

2. The effective capacitance (CEFF) of small, high-value, ceramic capacitors will decrease as bias voltage increases. The effects of bias voltage (DC bias characteristics), tolerance, and temperature must be considered.

3. Refer to Figure 17 in Application Information Section.

Table 5. THERMAL PROPERTIES

Symbol	Parameter	Typical	Unit
θ _{JA}	Junction-to-Ambient Thermal Resistance	50	°C/W

NOTE: Junction-to-ambient thermal resistance is a function of application and board layout. This data is measured with two-layer 2s2p boards in accordance to JEDEC standard JESD51. Special attention must be paid not to exceed junction temperature T_{J(max)} at a given ambient temperature T_A.

Table 6. ELECTRICAL SPECIFICATIONS (Note 4)

Minimum and maximum values are at $PV_{IN} = 2.5$ to 5.5 V and $PV_{IN} < V_{OUT} - 300$ mV, $EN = 1.8$ V, $PT = 0$ V, $T_A = -40^{\circ}\text{C}$ to $+85^{\circ}\text{C}$ unless otherwise specified. Typical values are at $T_A = 25^{\circ}\text{C}$, $PV_{IN} = 3.8$ V, $EN = 1.8$ V, $PT = 0$ V.

Symbol	Parameter	Conditions	Min	Typ	Max	Units
--------	-----------	------------	-----	-----	-----	-------

APPLICATION INFORMATION

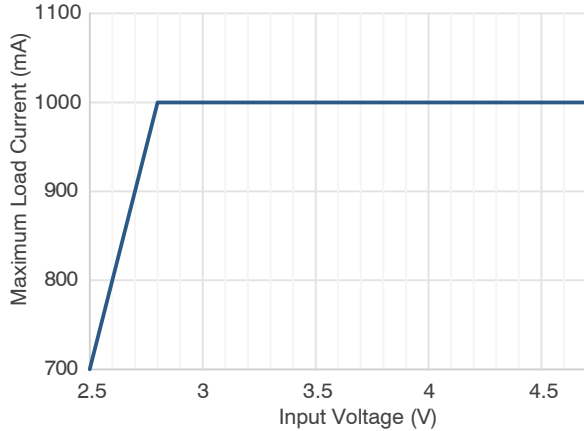

Figure 17. Load Capability vs. Input Voltage

Operation Description

The FAN48695 is a low-power boost regulator designed to provide a regulated output voltage from a single cell Lithium or Li-Ion battery. It maintains the output in regulation within the devices recommended operating conditions. For higher efficiency at low load conditions, the device will transition into PFM Mode.

Automatic Pass-Through Mode will occur during boost Mode if the input voltage rises close to or above the desired output voltage. Additionally, the device can be put into Forced Pass-Through Mode when boosting the output is not required by setting the PT pin to HIGH.

Startup Description

The FAN48695 can startup in either Boost Mode or Forced Pass-Through (FPT) Mode. Both modes use a two

stage linear soft-start to limit inrush currents from the source.

Linear Soft-Start State

An internal fixed current source of LIN1 is applied to V_{OUT} for up to 500 μ s. If V_{OUT} does not reach $V_{IN} - 300$ mV within 500 μ sec, the current source is increased to LIN2 for up to an additional 1 ms.

Boost Mode:

- If any time during the Linear Soft-Start State V_{OUT} charges up to $V_{IN} - 300$ mV, the fixed current source will be disabled and the device then proceeds to the Switching Soft-Start State.
- If V_{OUT} fails to charge up to $V_{IN} - 300$ mV by the end of LIN2, the fixed current source is disabled, a fault condition is declared, and the device waits 20 ms to attempt an automatic restart.

FPT Mode:

- If V_{OUT} charges up to V_{IN} , Forced Pass-Through Mode is achieved.
- If V_{OUT} fails to charge up to V_{IN} by the end of LIN2, the fixed current source is disabled, a fault condition is declared, and the device waits 20 ms to attempt an automatic restart.

Switching Soft-Start State

The regulator begins switching in PFM operation with I_{SW_LIM} set to one-quarter its normal value until V_{OUT} reaches its target voltage or 100 μ s has elapsed. The device will then transition to BOOST Mode with I_{SW_LIM} returned to its typical value.

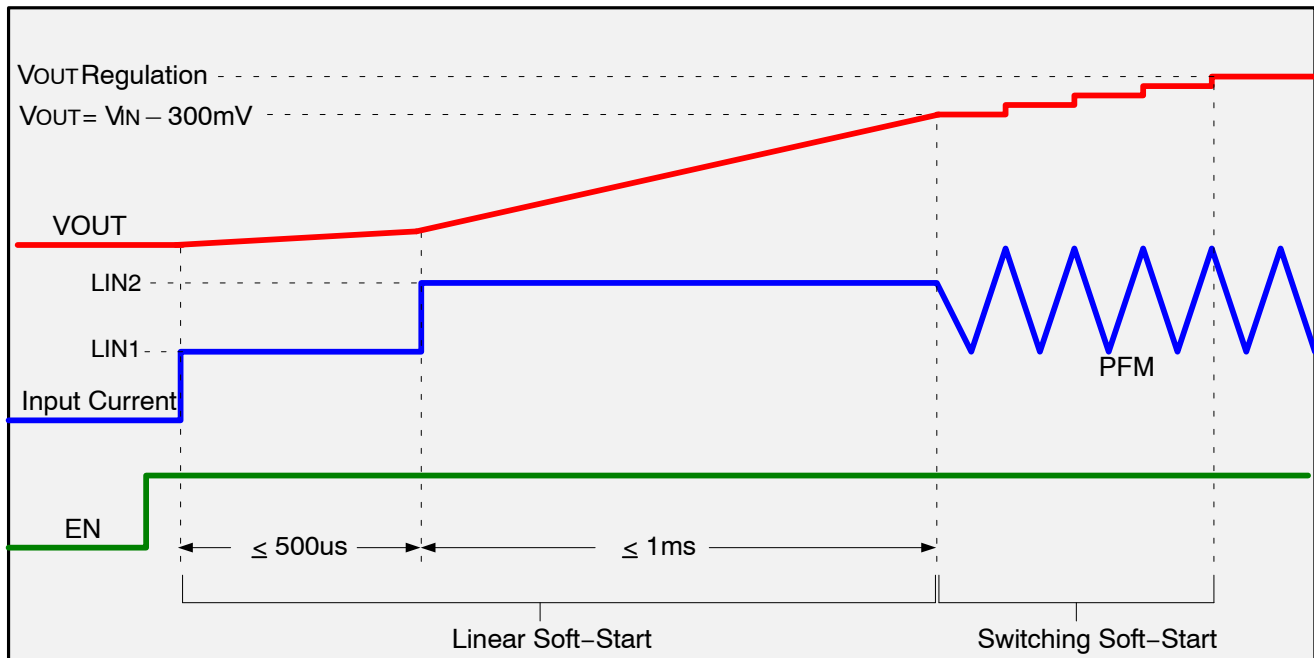

Figure 18. Boost Mode Startup

Shutdown Description

The boost can be disabled by asserting the EN pin low. The output (V_{OUT}) will discharge into the prevailing load.

Modes of Operation

Boost PWM Mode

During PWM mode, the boost regulates the output using a fixed switching frequency of ~2.5 MHz. As the load increases, the inductor current will have an increasing DC offset. The period of when the V_{SW} (voltage at switching

node) signal is low, will grow as the battery voltage in a mobile device decays.

Boost PFM Mode

The FAN48695 has PFM operation which improves efficiency at light loads. The device operates in PFM when the load current falls below approximately 80 mA. In PFM mode, the average output voltage is regulated higher than the average PWM output voltage to improve transient dips.

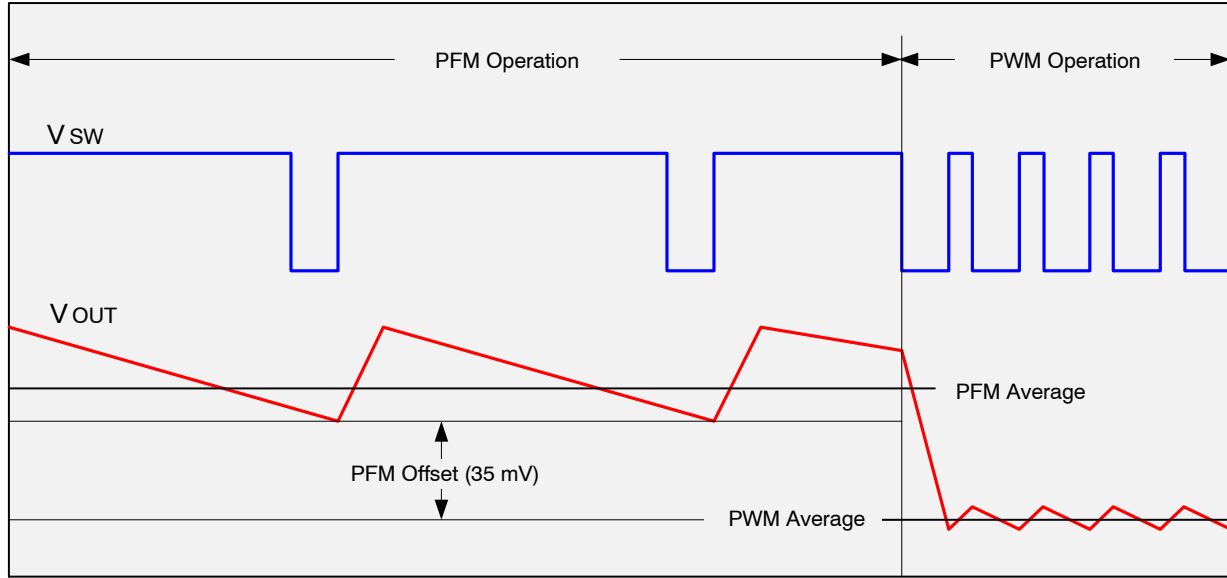

Figure 19. Boost Mode Operation

Automatic Pass-Through Operation

In normal operation, the device automatically transitions from Boost Mode to Pass-Through Operation if V_{IN} is more than the boost target voltage minus 250 mV for ≥5 μsec. In Pass-Through Mode, the device has a low impedance path between V_{IN} and V_{OUT} (R_{DS_{ON}_P} + L_{DCR}). The device will automatically exit Pass-Through Mode when V_{IN} is 350 mV less than the target boost voltage.

Forced Pass-Through Mode

When the PT pin is set to a logic HIGH and EN=HIGH, Forced Pass-Through mode occurs. In Pass-Through Mode, the device has a low impedance path between V_{IN} and V_{OUT} (R_{DS_{ON}_P} + L_{DCR}).

Protection Features

V_{OUT} Fault

If the output voltage is pulled down to 300 mV below V_{IN} by a heavy load, the device will fault to protect itself, the source, and the load.

Soft Start Fault

Refer to the Start-up section for additional detail. If the device fails to drive the output up to $V_{IN} - 300$ mV within 1.5 ms the device will fault due to sensing a heavy load. If the device is unable to bring the output up to regulation within 100 μ s after exiting the linear charging phases, the device will fault. In either case, the device will attempt a restart 20 ms later.

Current Limit (OCP)

FAN48695 has a current limit feature which protects itself, the inductor, and load during overload conditions. When the inductor peak current limit is reached and held for 2 ms, the device enters fault state.

During an output overload condition, if V_{OUT} falls 300 mV below V_{IN} the device enters fault state without waiting 2 ms.

In fault state, Q2 is completely opened to prevent current flow between PVIN and VOUT, in either direction. The device will attempt an automatic restart every 20 ms.

Automatic Pass-Through Mode Protection

During Automatic Pass-Through Mode, the device is short-circuit protected. If the voltage difference between V_{IN} and V_{OUT} exceed more than 350 mV for ≤ 10 μ s, a fault is declared. The part will automatically attempt a restart every 20ms until the short condition ceases.

Forced Pass-Through Mode Protection

In Forced Pass-Through Mode, fault protection occurs when V_{OUT} is dragged below $V_{IN} - 450$ mV. The device will automatically attempt a restart every 20 ms.

Thermal Shutdown (TSD)

When the die temperature increases, due to a high load condition and/or a rising ambient temperature, the output switching is disabled until the die temperature falls to the hysteresis threshold. The junction temperature at which the thermal shutdown activates is nominally T_{SD} with T_{HYS} hysteresis.

Under-Voltage Lockout (UVLO)

If the EN pin is HIGH, once rising V_{IN} reaches V_{UVLO_R} , the part will begin the Soft Start process. When falling V_{IN} reaches V_{UVLO_F} the output will go to a high Z state and the output voltage will decay into the prevailing load.

External Component Selection

Refer to Table 1: Recommended External Components.

Output Capacitance (C_{OUT})

It is recommended to use the output capacitor shown in the Recommended External Components table. If a different component is chosen, it is important that its effective capacitance is equal to or greater than that of the recommended component. See the Recommended Operating Conditions table for details. For better ripple performance, additional output capacitance can be added.

Output Voltage Ripple

Output voltage ripple is inversely proportional to C_{OUT} . During t_{ON} , when the boost switch is on, all load current is supplied by C_{OUT} .

$$V_{RIPPLE(P-P)} = t_{ON} \cdot \frac{I_{LOAD}}{C_{OUT}} \quad (\text{eq. 1})$$

And

$$t_{ON} = t_{SW} \cdot D = t_{SW} \cdot \left(1 - \frac{V_{IN}}{V_{OUT}}\right) \quad (\text{eq. 2})$$

therefore:

$$V_{RIPPLE(P-P)} = t_{SW} \cdot \left(1 - \frac{V_{IN}}{V_{OUT}}\right) \cdot \frac{I_{LOAD}}{C_{OUT}} \quad (\text{eq. 3})$$

$$t_{SW} = \frac{1}{f_{SW}} \quad (\text{eq. 4})$$

For better ripple performance, more output capacitance can be added.

Input Capacitance (C_{IN})

The 10 μ F ceramic 0402 input capacitor should be placed as close as possible between the PVIN pin and GND to minimize the parasitic inductance.

NOTE: The effective capacitance value decreases as V_{IN} increases due to DC bias effects. A high quality capacitor with ample voltage rating should be used for C_{IN} .

Inductor (L1)

The FAN48695 employs peak current limiting and there is a finite amount of time between when the peak current is detected and when the switch turns off. During overload conditions, peak currents will be safely limited to I_{SW_LIM} when using a properly rated inductor. Saturation effects should be considered during inductor selection.

Layout Guideline

The Recommended Layout shows all components on the top layer, top copper in RED and bottom copper in BLUE.

For thermal reasons, it is recommended to maximize the pour area for all planes other than SW.
