

Low-Voltage Dual-Supply 6-Bit Voltage Translator with Auto-Direction Sensing

FXL2SD106

WQFN16 3.5x2.5, 0.5P
 CASE 510CC

General Description

The FXL2SD106 is a configurable dual-voltage-supply translator designed for both uni-directional and bidirectional voltage translation between two logic levels. The device allows translation between voltages as high as 3.6 V to as low as 1.1 V. The A port tracks the V_{CCA} level and the B port tracks the V_{CCB} level. This allows for bi-directional voltage translation over a variety of voltage levels: 1.2 V, 1.5 V, 1.8 V, 2.5 V, and 3.3 V.

The device remains in 3-state until both V_{CC} reach active levels, allowing either V_{CC} to be powered-up first. Internal power-down control circuits place the device in 3-state if either V_{CC} is removed.

The OE input, when low, disables both A and B ports by placing them in a 3-state condition. The FXL2SD106 is designed so that OE and CLK IN are supplied by V_{CCA} .

The device senses an input signal on A or B port automatically. The input signal is transferred to the other port.

The FXL2SD106 is not designed for SD card applications. The internal bus hold circuitry conflicts with pull-up resistors. SD cards have internal pull-up resistors on the CD/DAT3 pins.

Features

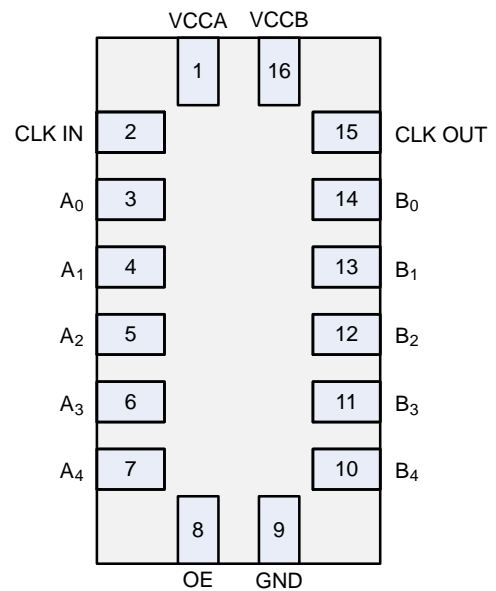

- Bi-Directional Interface between Two Levels: 1.1 V and 3.6 V
- Fully Configurable: Inputs and Outputs Track V_{CC} Level
- Non-Preferential Power-up; Either V_{CC} May Be Powered-up First
- Outputs Remain in 3-State until Active V_{CC} Level is Reached
- Outputs Switch to 3-State if Either V_{CC} is at GND
- Power-Off Protection
- Bus hold on Data Inputs Eliminates Need for Pull-up Resistors (Do NOT Use Resistors on the A or B Ports)
- OE and CLK IN are Referenced to V_{CCA} Voltage
- Packaged in 16-Terminal DQFN (2.5 mm x 3.5 mm)
- Direction Control Not Needed
- 80 Mbps Throughput Translating between 1.8 V and 2.5 V
- ESD Protection Exceeds:
 - ◆ 12 kV HBM (B port I/O to GND)
(per JESD22-A114 & Mil Std 883e 3015.7)
 - ◆ 8 kV HBM (A port I/O to GND)
(per JESD22-A114 & Mil Std 883e 3015.7)
 - ◆ 1 kV CDM (per ESD STM 5.3)

Power-Up/Power-Down Sequencing

FXL translators offer an advantage in that either V_{CC} may be powered up first. This benefit derives from the chip design. When either V_{CC} is at 0 volts, outputs are in a high-impedance state. The control input (OE) is designed to track the V_{CCA} supply. A pull-down resistor tying OE to GND should be used to ensure that bus contention, excessive currents, or oscillations do not occur during power-up / power-down. The size of the pull-down resistor is based upon the current-sinking capability of the device driving the OE pin.

The recommended power-up sequence is the following:

1. Apply power to the first V_{CC}.
2. Apply power to the second V_{CC}.
3. Drive the OE input high to enable the device.

The recommended power-down sequence is the following:

1. Drive OE input low to disable the device.
2. Remove power from either V_{CC}.
3. Remove power from other V_{CC}.

ABSOLUTE MAXIMUM RATINGS

3. This is the output voltage for static conditions. Dynamic drive specifications are given in "Dynamic Output Electrical Characteristics".
4. An external driver must source at least the specified current to switch LOW-to-HIGH.
5. An external driver must source at least the specified current to switch HIGH-to-LOW.
6. "Don't Care" indicates any valid logic level.
7. V_{CC1} is the V_{CC} associated with the input side.
8. Reflects current per supply, V_{CCA} or V_{CCB}.
