## Description

The HCPL06XX optocouplers consist of an AlGaAs LED, optically coupled to a very high speed integrated photo-detector logic gate with a strobable output (single channel devices). The devices are housed in a compact small-outline package. This output features an open collector, thereby permitting wired OR outputs. The HCPL0600, HCPL0601 and HCPL0611 output consists of bipolar transistors on a bipolar process while the HCPL0637, HCPL0638, and HCPL0639 output consists of bipolar transistors on a CMOS process for reduced power consumption. The coupled parameters are guaranteed over the temperature range of  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$ . An internal noise shield provides superior common mode rejection.

### Notes:

- The  $V_{CC}$  supply to each optoisolator must be bypassed by a  $0.1 \mu\text{F}$  capacitor or larger. This can be either a ceramic or solid tantalum capacitor with good high frequency characteristic and should be connected as close as possible to the package  $V_{CC}$  and GND pins of each device.
- Enable Input – No pull up resistor required as the device has an internal pull up resistor.
- $t_{PLH}$  – Propagation delay is measured from the  $3.75$  mA level on the HIGH to LOW transition of the input current pulse to the  $1.5$  V level on the LOW to HIGH transition of the output voltage pulse.
- $t_{PHL}$  – Propagation delay is measured from the  $3.75$  mA level on the LOW to HIGH transition of the input current pulse to the  $1.5$  V level on the HIGH to LOW transition of the output voltage pulse.
- $t_r$  – Rise time is measured from the  $90\%$  to the  $10\%$  levels on the LOW to HIGH transition of the output pulse.
- $t_f$  – Fall time is measured from the  $10\%$  to the  $90\%$  levels on the HIGH to LOW transition of the output pulse.
- $t_{ELH}$  – Enable input propagation delay is measured from the  $1.5$  V level on the HIGH to LOW transition of the input voltage pulse to the  $1.5$  V level on the LOW to HIGH transition of the output voltage pulse.
- $t_{EHL}$  – Enable input propagation delay is measured from the  $1.5$  V level on the LOW to HIGH transition of the input voltage pulse to the  $1.5$  V level on the HIGH to LOW transition of the output voltage pulse.
- $CM_H$  – The maximum tolerable rate of rise of the common mode voltage to ensure the output will remain in the high state (i.e.,  $V_{OUT} > 2.0$  V). Measured in volts per microsecond (V/ $\mu\text{s}$ ).
- $CM_L$  – The maximum tolerable rate of fall of the common mode voltage to ensure the output will remain in the low output state (i.e.,  $V_{OUT} < 0.8$  V). Measured in volts per microsecond (V/ $\mu\text{s}$ ).
- Device considered a two-terminal device: Pins 1, 2, 3 and 4 shorted together, and Pins 5, 6, 7 and 8 shorted together.
