

3.3 V USB 3.2 10 Gbps Dual Channel / Single Port Linear Redriver

NB7NPQ1402E2M

Description

The NB7NPQ1402E2M is a high performance single-Port linear redriver designed for USB 3.2 applications that supports both 5 Gbps and 10 Gbps data rates. Signal integrity degrades from PCB traces, transmission cables, and inter-symbol interference (ISI). The NB7NPQ1402E2M compensates for these losses by engaging varying levels of equalization at the input receiver, and flat gain amplification on the output transmitter.

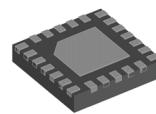

The NB7NPQ1402E2M offers programmable equalization and flat gain for each independent channel to optimize performance over various physical mediums.

The NB7NPQ1402E2M contains an automatic receiver detect function which will determine whether the output is active. The receiver detection loop will be active if the corresponding channel's signal detector is idle for a period of time. The channel will then move to Unplug Mode if a load is not detected, or it will return to Low Power Mode (Slumber mode) due to inactivity.

The NB7NPQ1402E2M comes in a 2.5 x 2.5 x 0.5 mm UQFN24 package and is specified to operate across the entire industrial temperature range, -40°C to 85°C.

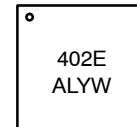

Features

- 3.3 V ± 0.3 V Power Supply
- 5 Gbps & 10 Gbps Serial Link with Linear Amplifier
- Device Supports USB 3.2 Gen2 and Gen1
- Automatic Receiver Detection
- Supports USB-IF VCM Requirement
- Integrated Input and Output Termination
- Pin Adjustable Receiver Equalization and Flat Gain
- 100 Ω Differential CML I/O's
- Auto Slumber Mode for Adaptive Power Management
- Hot-Plug Capable
- ESD Protection ±4 kV HBM
- Operating Temperature Range Industrial:
-40°C to +85°C
- Package: UQFN24, 2.5 x 2.5 x 0.5 mm
- This is a Pb-Free Device

Table 1. PIN DESCRIPTION

Pin Number	Pin Name	Type	Description
1	EQA	INPUT	Pin for control of Channel A Equalization setting having internal 100 kΩ pull up and 200 kΩ pull-down resistors. 4 state input: HIGH "H" where pin is connected to VDD, LOW "L" where pin is connected to Ground, FLOAT "F" where the pin is left floating (open) and Rext "R" where an external resistor Rext 68 kΩ is connected from pin to Ground. FLOAT "F" is the default setting.
2	FGA	INPUT	Pin for control of Channel A Flat Gain setting having internal 100 kΩ and 200 kΩ pull-down resistors. 4 state input: HIGH "H" where pin is connected to VDD, Low "L" where pin is connected to Ground, FLOATING "F" where the pin is left floating (open) and Rext "R" where an external resistor Rext
3	SWA	INPUT	Pin for control of Channel A Swing levels having internal 100 kΩ and 200 kΩ pull-down resistors. 4 state input: HIGH "H" where pin is connected to VDD, LOW "L" where pin is connected to Ground, FLOAT "F" where the pin is left floating (open) and Rext "R" where an external resistor Rext 68 kΩ is connected from pin to Ground. FLOAT "F" is the default setting.
4	EN	INPUT	Pin for device channel Enable having an internal 300 kΩ pull-up resistor. HIGH "1" where pin is connected to , LOW "0" where pin is connected to Ground. Default is "1" pin is Enabled, Low Pin is disabled.
5, 17	VDD	POWER	3.3 V power supply. VDD pins must be externally connected to power supply.
6	A_RX+	INPUT	Channel A Differential CML input pair for 5 / 10 Gbps USB signals. Must be externally AC-coupled in system. UFP/DFP transmitter should provide this capacitor.
7	A_RX-		
9, 21	GND	GND	Reference Ground. GND pins must be externally connected to power supply ground to guarantee proper operation.
11	B_TX-	OUTPUT	Channel B Differential output for 5 / 10 Gbps USB signals. Must be externally AC-coupled in system
12	B_TX+		
13	RXDET_EN	INPUT	Receiver Detection enable pin. High-receiver detection is ENABLED. Low-receiver detection is DISABLED. Internal pull-up; default is high when open. The RXDET_EN pin must be powered simultaneously with VDD. After device is powered up, toggle the RXDET_EN pin from High to Low to DISABLE RX DETECT function.
14	SWB	INPUT	Pin for control of Channel B Swing Levels having an internal 100 kΩ pull up and 200 kΩ pull-down resistors. 4 state input: HIGH "H" where pin is connected to VDD, LOW "L" where pin is connected to Ground, FLOAT "F" where the pin is left floating (open) and Rext "R" where an external resistor Rext 68 kΩ is connected from pin to Ground. FLOAT "F" is the default setting.
15	FGB	INPUT	Pin for control of Channel B Flat Gain setting having internal 100 kΩ pull-up and 200 kΩ pull-down resistors. 4 state input: HIGH "H" where pin is connected to VDD, LOW "L" where pin is connected to Ground, FLOAT "F" where the pin is left floating (open) and Rext "R" where an external resistor Rext 68 kΩ is connected from pin to Ground. FLOAT "F" is the default setting
16	EQB	INPUT	Pin for control of Channel B Equalization setting having terminal 100 kΩ pull-up and 200 kΩ pull-down resistors. 4 state input: HIGH "H" where pin is connected to VDD, LOW "L" where pin is connected to Ground, FLOAT "F" where the pin is left floating (open) and Rext "R" where an external resistor Rext 68 kΩ is connected from pin to Ground. FLOAT "F" is the default setting.
18	B_RX+	INPUT	Channel B Differential CML input pair for 5 / 10 Gbps USB signals. Must be externally AC-coupled in system
19	B_RX-		
23	A_TX-	OUTPUT	Channel A Differential output for 5 / 10 Gbps USB signals. Must be externally AC-coupled in system.
24	A_TX+		
EP	GND	GND	Exposed Pad (EP). EP on the package bottom is thermally connected to the die for improved heat transfer out of the package. The expose pad is electrically connected to the die and must be soldered to GND on the PC board.

Power Management

The NB7NPQ1402E2M has an adaptive power management feature in order to minimize power consumption. When the receiver signal detector is idle, the corresponding channel will change to low power slumber mode. Accordingly, both channels will move to low power slumber mode individually.

While in the low power slumber mode, the receiver signal detector will continue to monitor the input channel. If a channel is in low power slumber mode, the receiver detection loop will be active again. If a load is not detected, then the channel will move to Device Unplug Mode and continuously monitor for the load. When a load is detected, the channel will return to Low Power Slumber Mode and receiver detection will be active again per 6 ms.

APPLICATION GUIDELINES**LFPS Compliance Testing**

As part of USB 3.2 compliance test, the host or peripheral must transmit a LFPS signal that adheres to the spec parameters. The NB7NPQ1402E2M is tested as a part of a USB compliant system to ensure that it maintains compliance while increasing system performance.

LFPS Functionality

USB 3.2 Low Frequency Periodic Signaling.

(LFPS) to implement functions like exiting low-power modes, performing warm resets and providing link training between host and peripheral devices. LFPS signaling consists of bursts of frequencies ranging between 10 to 50 MHz and can have specific burst lengths or repeat rates.

Ping.LFPS for TX Compliance

During the transmitter compliance, the system under test must transmit certain compliance patterns as defined by the USB-IF. In order to toggle through these patterns for various tests, the receiver must receive a ping.LFPS signal from either the test suite or a separate pattern generator. The standard signal comprises of a single burst period of 100 ns at 20 MHz.

Control Pin Settings

Control pins SWA, FGA, EQA, SWB, FGB, and EQB control the Output Swing, Flat Gain and the Equalization of channels A and B of the NB7NPQ1402E2M Device.

The Float (Default) Setting “F” can be set by leaving the control pins in a floating state. The Redriver will internally bias the control pins to the correct voltage to achieve this if the pin is not connected to a voltage source. The low Setting “L” is set by pulling the control pin to ground. Likewise the high setting “H” is set by pulling the pin high to VCC. The Rexternal setting can be set by adding a 68 kΩ resistor from the control pin to ground. This will bias the Redriver internal voltage to 33% of VCC.

Linear Equalization

The linear equalization that the NB7NPQ1402E2M provides compensates for losses that occur naturally along board traces and cable lines. Linear Equalization boosts high frequencies and lower frequencies linearly so when transmitting at varying frequencies, the voltage amplitude will remain consistent. This compensation electrically counters losses and allows for longer traces to be possible when routing.

DC Flat Gain

DC flat gain equally boosts high and low frequency signals, and is essential for countering low frequency losses.

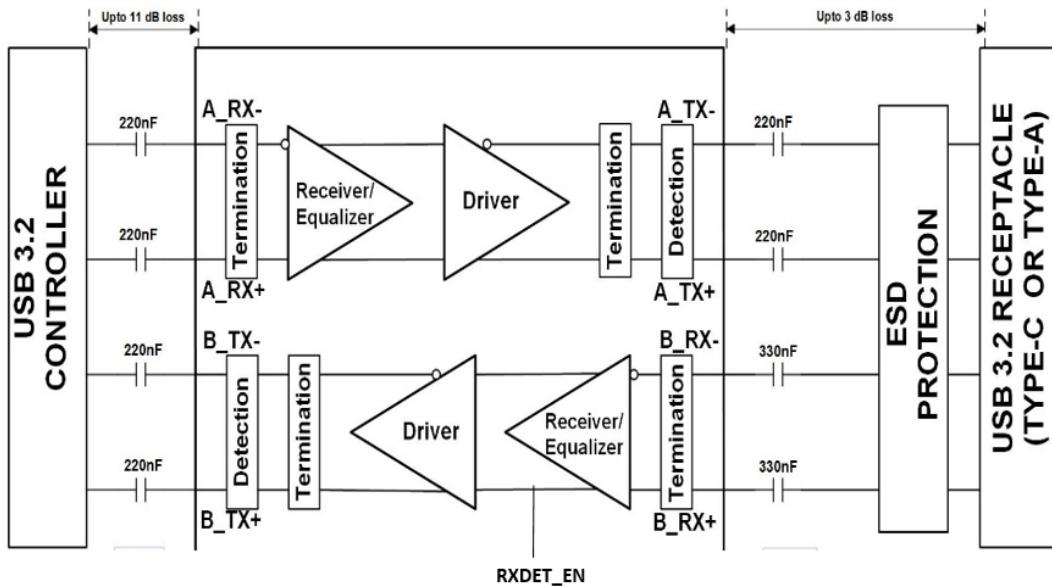

DC flat gain can also be used to simulate a higher input signal from a USB Controller. If a USB controller can only provide 800 mV differential to a receiver, it can be boosted to 1128 mV using 2 dB of flat gain.

Total Gain

When using Flat Gain with Equalization in a USB application it is important to make sure that the total voltage does not exceed 1200 mV. Total gain can be calculated by adding the EQ gain to the FG.

Typical Layout Practices

- RX and TX pairs should maintain as close to a 90 Ω differential impedance as possible.
- Limit the number of vias used on each data line. It is suggested that two or fewer are used.
- Traces should be routed as straight and symmetric as possible.
- RX and TX differential pairs should always be placed and routed on the same layer directly above a ground plane. This will help reduce EMI and noise on the data lines.
- Routing angles should be obtuse angles and kept to 135° or larger.
- To minimize crosstalk, TX and RX data lines should be kept away from other high speed signals.

Table 17. DESIGN REQUIREMENTS

Design Parameter	Value
Supply Voltage	3.3 V nominal, (3.0 V to 3.6 V)
Operation Mode (Control Pin Selection)	Floating by Default, adjust for application losses
TX AC Coupling Capacitors	220 nF nominal, 75 nF to 265 nF, see Figure 8
RX AC Coupling Capacitors	330 – 470 nF nominal, see Figure 8
Power Supply Capacitors	100 nF to GND close to each VCC pin, and 10 mF to GND on the VCC plane
Trace loss of FR4 before NB7NPQ1402E2M (Note 10)	Up to 11 dB Losses
Trace loss of FR4 after NB7NPQ1402E2M (Note 10)	Up To 3 dB Losses. Keep as short as possible for best performance.
Linear Range at 5 GHz	900 mV differential
DC Flat Gain Options	-1.2 dB, -0.2 dB, +0.8 dB, +1.8 dB
Equalization Options	6.9 to 12.1 dB
Differential Trace Impedance	90 Ω ±10%

10. Trace loss of FR4 was estimated to have 1 dB of loss per 1 inch of FR4 length with matched impedance and no VIAS.
