## Soft-Start Controlled Load Switch with Auto Discharge

The NCP331 is a low  $R_{DS(on)}$  N-channel MOSFET controlled by a soft-start sequence of 2 ms for mobile applications. The very low  $R_{DS(on)}$  allows system supplying or battery charging up to DC 2A. The device is enable due to external, active high, enable pin.

Due to a current consumption optimization, leakage current is drastically decreased from the battery connected to the device, allowing long battery life.

### Features

- 1.8 V – 5.5 V Operating Range
- 33 m $\Omega$  N MOSFET
- DC Current Up to 2 A
- Peak Current Up to 5 A
- Built-in Soft-Start 2 ms
- Reverse Voltage Protection
- Output Discharge
- EN Logic Pin: Active High
- ESD Ratings:  
Machine Model = B  
Human Body Model = 2
- TSOP23–6 package
- This is a Pb-Free Device

### Typical Applications

- Mobile Phones
- Tablets
- Digital Cameras
- GPS
- Computers

## PIN FUNCTION DESCRIPTION

Pin Name	Pin Number	Type	Description
IN	5,6	POWER	Power-switch input voltage; connect a 0.1 $\mu$ F or greater ceramic capacitor from IN to GND as close as possible to the IC.
GND	4	POWER	Ground connection.
EN	3	INPUT	Enable input, logic high turns on power switch.
OUT	1,2	OUTPUT	Power-switch output; connect a 0.1 $\mu$ F ceramic capacitor from OUT to GND as close as possible to the IC is recommended.

## FUNCTIONAL DESCRIPTION

### Overview

The NCP331 is a high side N channel MOSFET power distribution switch designed to connect external voltage directly to the system.

### Enable Input

Enable pin is an active high.

The part is in disable mode when EN is tied to low. Power MOSFET is opened. Pull down resistor is placed to maintained the part off if En pin is not externally driven.

The parts becomes in enable mode if EN is tied high and Power MOSFET is turned of after ten and  $t_{rise}$  times.

### Auto Discharge

NMOS FET is placed between the output pin and GND, in order to discharge the application capacitor connected on OUT pin.

The auto-discharge is activated when EN pin is set to low level (disable state).

The discharge path (Pull down NMOS) stays activated as long as EN pin is set at low level.

### Blocking Control

The blocking control circuitry switches the bulk of the power NMOS. When the part is off (No  $V_{in}$  or EN tied to GND externally), the body diode limits the leakage current  $I_{REV}$  from OUT to IN. In this mode, anode of the body diode is connected to IN pin and cathode is connected to OUT pin. In operating condition, anode of the body diode is connected to OUT pin and cathode is connected to IN pin preventing the discharge of the power supply.

## APPLICATION INFORMATION

### Power Dissipation

The device's junction temperature depends on different contributor factor such as board layout, ambient temperature, device environment, etc... Yet, the main contributor in term of junction temperature is the power dissipation of the power MOSFET. Assuming this, the power dissipation and the junction temperature in normal mode can be calculated with the following equations:

$$P_D = R_{DS(on)} \times (I_{OUT})^2$$

$P_D$  = Power dissipation (W)  
 $R_{DS(on)}$  = Power MOSFET on resistance ( $\Omega$ )  
 $I_{OUT}$  = Output current (A)

$$T_J = P_D \times R_{\theta JA} + T_A$$

$T_J$  = Junction temperature ( $^{\circ}C$ )  
 $R_{\theta JA}$  = Package thermal resistance ( $^{\circ}C/W$ )  
 $T_A$  = Ambient temperature ( $^{\circ}C$ )

### PCB Recommendations

The NCP331 integrates an up to 2A rated NMOS FET, and the PCB design rules must be respected to properly evacuate the heat out of the silicon. By increasing PCB area, the  $R_{\theta JA}$  of the package can be decreased, allowing higher power dissipation.
