

NCP4894

Audio Power Amplifier, 1.8 Watt, with Selectable Shutdown

The NCP4894 is a differential audio power amplifier designed for portable communication device applications. This feature and the excellent audio characteristics of the NCP4894 are a guarantee of a high quality sound, for example, in mobile phones applications. With a 10% THD+N value the NCP4894 is capable of delivering 1.8 W of continuous average power to an 8.0 Ω load from a 5.5 V power supply. With the same load conditions and a 5.0 V battery voltage, it ensures 1.0 W to be delivered with less than 0.01% distortion.

The NCP4894 provides high quality audio while requiring few external components and minimal power consumption. It features a low-power consumption shutdown mode.

To be flexible, shutdown may be enabled by either a logic high or low depending on the voltage applied on the SD MODE pin.

The NCP4894 contains circuitry to prevent from “pop and click” noise that would otherwise occur during turn-on and turn-off transitions.

For maximum flexibility, the NCP4894 provides an externally controlled gain (with resistors), as well as an externally controlled turn-on time (with bypass capacitor).

Due to its excellent PSRR, it can be directly connected to the battery, saving the use of an LDO.

This device is available in 9-Pin Flip-Chip, Micro-10 and DFN10 3x3 mm packages.

Features

- Differential Amplification
- Shutdown High or Low Selectivity
- 1.0 W to an 8.0 Ω Load from a 5.0 V Power Supply
- Superior PSRR: Direct Connection to the Battery
- “Pop and Click” Noise Protection Circuit
- Ultra Low Current Shutdown Mode
- 2.2 V–5.5 V Operation
- External Gain Configuration Capability
- External Turn-on Configuration Capability
- Thermal Overload Protection Circuitry
- Pb-Free Packages are Available

Typical Applications

- Portable Electronic Devices
- PDAs
- Mobile Phones

DFN10

PIN DESCRIPTION

9-Pin Flip-Chip	Micro-10/DFN10	Type	Symbol	Description
A1	4	I	INP	Positive Differential Input
A2	5	O	BYPASS	Bypass Capacitor Pin which Provides the Common Mode Voltage
A3	6	I	OUTB	Negative BTL Output
B1	9	I	VP	Positive Analog Supply of the Cell
B2	3	I	SD MODE	Shutdown High or Low Selectivity (Note 1)
B3	7	I	VM	Ground
C1	2	I	INM	Negative Differential Input
C2	1	O	SD SELECT	(Note 1)
C3	10	I	OUTA	Positive BTL Output

1. The SD SELECT pin must be toggled to the same state as the SD MODE pin to force the device in shutdown mode.

NCP4894

MAXIMUM RATINGS (Note 2)

Rating	Symbol	Value	Unit
Supply Voltage	VP	6.0	V
Operating Supply Voltage	Op VP	2.2 to 5.5 V	–
Input Voltage	V _{in}	–0.3 to V _{cc} +0.3	V
Max Output Current	I _{out}	500	mA
Power Dissipation (Note 3)	P _d	Internally Limited	–
Operating Ambient Temperature	T _A	–40 to +85	°C
Max Junction Temperature	T _J	150	°C
Storage Temperature Range	T _{stg}	–65 to +150	°C
Thermal Resistance Junction-to-Air	R _{θJA}	200 70 (Note 4)	°C/W
ESD Protection	Human Body Model (HBM) (Note 5) Machine Model (MM) (Note 6)	– > 2000 > 200	V
Latchup Current at T _A = 85°C (Note 7)	–	±100 mA	

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

- Maximum electrical ratings are defined as those values beyond which damage to the device may occur at T_A = +25°C.
- The thermal shutdown set to 160°C (typical) avoids irreversible damage on the device due to power dissipation. For further information see page 7.
- For the 9-Pin Flip-Chip CSP package, the R_{θJA} is highly dependent of the PCB Heatsink area. For example, R_{θJA} can equal 195°C/W with 50 mm² total area and also 135°C/W with 500 mm². For further information see page 10. The bumps have the same thermal resistance and all need to be connected to optimize the power dissipation.
- Human Body Model, 100 pF discharge through a 1.5 kΩ resistor following specification JESD22/A114.
- Machine Model, 200 pF discharged through all pins following specification JESD22/A115.
- Maximum ratings per JEDEC standard JESD78.

NCP4894

ELECTRICAL CHARACTERISTICS Limits apply for T_A between -40°C to $+85^{\circ}\text{C}$ (Unless otherwise noted).

APPLICATION INFORMATION

Detailed Description

The NCP4894 audio amplifier can operate under 2.6 V until 5.5 V power supply. It delivers 320 mW rms output power to 4.0 Ω load ($V_P = 2.6$ V) and 1.0 W rms output power to 8.0 Ω load ($V_P = 5.0$ V).

The structure of the NCP4894 is basically composed of two identical internal power amplifiers. Both are externally configurable with gain-setting resistors R_{in} and R_f (the closed-loop gain is fixed by the ratios of these resistors). The load is driven differentially through OUTA and OUTB outputs. This configuration eliminates the need for an output coupling capacitor.

Internal Power Amplifier

The output PMOS and NMOS transistors of the amplifier were designed to deliver the output power of the specifications without clipping. The channel resistance (R_{on}) of the NMOS and PMOS transistors does not exceed 0.6 Ω when they drive current.

The structure of the internal power amplifier is composed of three symmetrical gain stages, first and medium gain stages are transconductance gain stages to obtain maximum bandwidth and DC gain.

Turn-On and Turn-Off Transitions

A cycle with a turn-on and turn-off transition is illustrated with plots that show both single ended signals on the previous page.

In order to eliminate “pop and click” noises during transitions, output power in the load must be slowly established or cut. When logic high is applied to the shutdown pin, the bypass voltage begins to rise exponentially and once the output DC level is around the common mode voltage, the gain is established slowly (20 ms). Using this turn-on mode, the device is optimized in terms of rejection of “pop and click” noises.

A theoretical value of turn-on time at 25°C is given by the following formula.

C_{by} : bypass capacitor

R: internal 150 k resistor with a 25% accuracy

$$T_{on} = 0.95 * R * C_{by}$$

The device has the same behavior when it is turned-off by a logic low on the shutdown pin. During the shutdown mode, amplifier outputs are connected to the ground. However, to totally cut the output audio signal, you only need to wait for 20 ms.

Shutdown Function

The device enters shutdown mode once the SD SELECT and SD MODE pins are in the same logic state. This brings flexibility to the design, as the SD MODE pin must be permanently connected to VP or GND on the PCB. If the SD SELECT pin is not connected to the output of a microcontroller or microprocessor, it's not advisable to let it float. A pulldown or pullup resistor is then suitable.

During the shutdown state, the DC quiescent current has a typical value of 10 nA.

Current Limit Circuit

The maximum output power of the circuit ($P_{orms} = 1.0$ W, $V_P = 5.0$ V, $R_L = 8.0$ Ω) requires a peak current in the load of 500 mA.

In order to limit the excessive power dissipation in the load when a short-circuit occurs between both outputs, the current limit in the load is fixed to 800 mA.

Thermal Overload Protection

Internal amplifiers are switched off when the temperature exceeds 160°C, and will be switched on again only when the temperature decreases below 140°C.

The NCP4894 is unity-gain stable and requires no external components besides gain-setting resistors, an input coupling capacitor and a proper bypassing capacitor in the typical application.

Both internal amplifiers are externally configurable (R_f and R_{in}) with gain configuration.

The differential-ended amplifier presents two major advantages:

- The possible output power is four times larger (the output swing is doubled) as compared to a single-ended amplifier under the same conditions.
- Output pins (OUTA and OUTB) are biased at the same potential $V_P/2$, this eliminates the need for an output coupling capacitor required with a single-ended amplifier configuration.

The differential closed loop-gain of the amplifier is given by $A_{vd} = * \frac{R_f}{R_{in}} = \frac{V_{orms}}{V_{inrms}}$. V_{orms} is the rms value of the voltage seen by the load and V_{inrms} is the rms value of the input differential signal.

Output power delivered to the load is given by $P_{orms} = \frac{(V_{opeak})^2}{2 * R_L}$ (V_{opeak} is the peak differential output voltage).

When choosing gain configuration to obtain the desired output power, check that the amplifier is not current limited or clipped.

The maximum current which can be delivered to the load is 500 mA $I_{opeak} = \frac{V_{opeak}}{R_L}$.
