

Single Channel 10A High Speed Low-Side MOSFET Driver

NCP81074A, NCP81074B

The NCP81074 is a single channel, low-side MOSFET driver. It is capable of providing large peak currents into capacitive loads. This driver can deliver a 7 A peak current at the Miller plateau region to help reduce the Miller effect during MOSFETs switching transitions. It exhibits a split output configuration allowing the user to control the turn on and turn off slew rates. This part is available in SOIC-8 and DFN8 2x2 mm packages.

Features

- High Current Drive Capability ± 10 A
- TTL/CMOS Compatible Inputs Independent of Supply Voltage
- High Reverse Current Capability (10 A) Peak
- 4 ns Typical Rise and 4 ns Typical Fall Times with 1.8 nF Load
- Fast Propagation Delay Times of 15 ns with Input Falling and 15 ns with Input Rising
- Input Voltage Range from 4.5 V to 20 V
- Split Output Configuration
- Dual Input Design Offering Drive Flexibility
- These Devices are Pb-Free, Halogen Free/BFR Free and are RoHS Compliant

Applications

- Server Power
- Telecommunication, Datacenter Power
- Synchronous Rectifier
- Switch Mode Power Supply
- DC/DC Converter
- Power Factor Correction
- Motor Drive
- Renewable Energy, Solar Inverter

PIN DESCRIPTION

Pin No.	Symbol	Description
1	IN+	Non-Inverting Input which has logic compatible threshold and hysteresis. If not used, this pin should be connected to VDD. It should not be left unconnected.
2	GND	Common ground. This ground should be connected very closely to the source of the power MOSFET.
3	GND	Common ground. This ground should be connected very closely to the source of the power MOSFET.
4	OUTL	Sink pin. Connect to Gate of MOSFET.
5	OUTH	Source Pin. Connect to Gate of MOSFET.
6	VDD	Power Supply Input Pin.
7	VDD	Power supply Input Pin.
8	IN-	Inverting Input which has logic compatible threshold and hysteresis. If not used, this pin should be connected to GND. It should not be left unconnected.

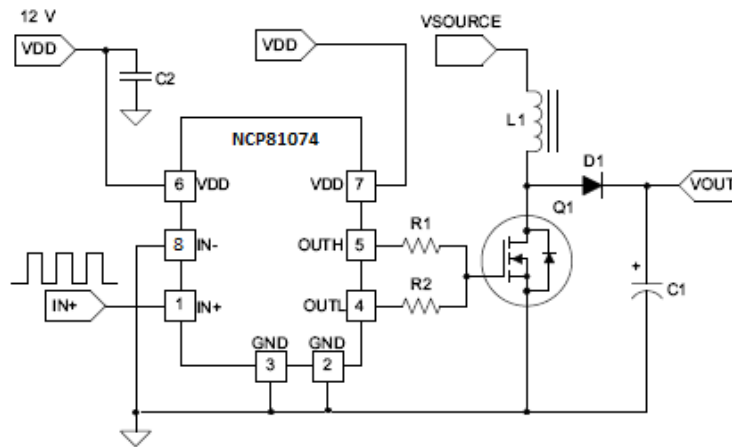

Figure 2. TYPICAL APPLICATION CIRCUIT

ABSOLUTE MAXIMUM RATINGS

Parameter		Value		Unit
		Min	Max	
Supply Voltage	VDD	−0.3	24	V
Output Current (DC)	Iout_dc	0.6		A
Reverse Current (Pulse<1 μs)			10	A
Output Current (Pulse<0.5 μs)	Iout_pulse	10		A
Input Voltage	IN+, IN−	−6	24	V
Output Voltages	OUTH, OUTL	−0.3	VDD + 0.3	V
Output Voltages (Pulse<0.5 μs)	OUTH, OUTL	−3.0	VDD + 3.0	V
Junction Operation Temperature	TJ	−40	150	°C
Storage Temperature	Tstg	−65	160	
Electrostatic Discharge	Human body model, HBM	4000		V
	Charge device model, CDM	1000		
OUT Latch-up Protection		500		mA
Moisture Sensitivity Level (MSL)		MSL1		

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

NCP81074A, NCP81074B

RECOMMENDED OPERATING CONDITIONS

Parameter	Rating	Unit
VDD supply Voltage	4.5 to 20	V
IN+, IN- input voltages	-5 to 20	V
Junction Temperature Range	-40 to +140	°C

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

Table 1. THERMAL INFORMATION

Package	Theta JA (°C/W)	Theta JC (°C/W)
DFN-8 2x2	80.3	11.9
SOIC-8	115	50

Table 2. ELECTRICAL CHARACTERISTICS (Note 1) (Typical values: VDD = 12V, 1uF from VDD to GND, TA = TJ = -40°C to 140°C, typical at TAMB = 25°C, unless otherwise specified)

PCB LAYOUT RECOMMENDATION

Proper component placement is extremely important in high current, fast switching applications to provide appropriate device operation and design robustness. The NCP81074 gate driver exhibits a powerful output stage enabling large peak currents with fast rise and fall times. Eventhough the NCP81074 provides a split output configuration for slew rate control, a proper PCB layout is crucial to ensure maximum performance. The following circuit layout guidelines are strongly recommended when designing with the NCP81074.

- Place the driver close to the power MOSFET in order to have a low impedance path between the output pins and the gate. Keep the traces short and wide to minimize the parasitic inductance and accommodate for high peak currents.
- Place the decoupling capacitor close to the gate drive IC. Placing the VDD capacitor close to the pin and ground improves noise filtering. This capacitor supplies

high peak currents during the turn-on transition of the MOSFET. Using a low ESL chip capacitor is highly recommended.

- Keep a tight turn-on turn-off current loop paths to minimize parastic inductance. High di/dt will induce voltage spikes on the output pin and the MOSFET gate. Parallel the source and return signals taking advantage of flux cancellation.
- Since the NCP81074 is a 2x2mm package driving high peak currents into capacitive loads, adding a shielding ground plane helps in power dissipation and noise blocking. The ground plane should not be a current carrying path to any of the current loops.
- Any unused pin, should be pulled to either rail depending on the functionality of the pin to avoid any malfunction on the output. Please refer to the pin description table for more information.
