Intelligent Power Module (IPM)
1200 V, 10 A

Advance Information
NFAM1012L5BT

The NFAM1012L5BT is a fully−integrated inverter power module consisting of an independent High side gate driver, LVIC, six IGBT's and a temperature sensor (TSU by LVIC and NTC Thermistor), suitable for driving permanent magnet synchronous (PMSM) motors, brushless DC (BLDC) motors and AC asynchronous motors. The IGBT's are configured in a three−phase bridge with separate emitter connections for the lower legs for maximum flexibility in the choice of control algorithm.

The power stage has under−voltage lockout protection (UVP). Internal boost diodes are provided for high side gate boost drive.

Features
- Three−phase 1200 V, 10 A IGBT Module with Independent Drivers
- Active Logic Interface
- Built−in Under−voltage Protection (UVP)
- Integrated Bootstrap Diodes and Resistors
- Separate Low−side IGBT Emitter Connections for Individual Current Sensing of Each Phase
- Temperature Sensor (TSU Output by LVIC or NTC Thermistor)
- UL Certification: E339285
- This is a Pb−Free Device

Typical Application
- Industrial Drives
- Industrial Pumps
- Industrial Fans
- Industrial Automation

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.
1. Refer to ELECTRICAL CHARACTERISTICS, RECOMMENDED OPERATING RANGES and/or APPLICATION INFORMATION for Safe Operating parameters.
2. This surge voltage developed by the switching operation due to the wiring inductance between P and NU, NV, NW terminal.

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

6. Performance guaranteed over the indicated operating temperature range by design and/or characterization tested at T$_J$ = T$_A$ = 25°C. Low duty cycle pulse techniques are used during testing to maintain the junction temperature as close to ambient as possible.
7. The fault–out pulse width tFOD depends on the capacitance value of CFOD according to the following approximate equation:
   tFOD = (TBD) x 10^6 x CFOD (s).
8. Values based on design and/or characterization.
