

2-Bit 20 Mb/s Dual-Supply Level Translator

NLSX4302E

The NLSX4302E is a 2-bit configurable dual-supply bidirectional auto sensing translator that does not require a directional control pin. The V_{CC} I/O and V_L I/O ports are designed to track two different power supply rails, V_{CC} and V_L respectively. Both the V_{CC} and V_L supply rails are configurable from 1.5 V to 5.5 V. This allows voltage logic signals on the V_L side to be translated into lower, higher or equal value voltage logic signals on the V_{CC} side, and vice-versa.

The NLSX4302E translator uses external pull-up resistors on the I/O lines. The external pull-up resistors are used to pull up the I/O lines to either V_L or V_{CC} . The NLSX4302E is an excellent match for open-drain applications such as the I²C communication bus.

Features

- V_L can be Less than, Greater than or Equal to V_{CC}
- Wide V_{CC} Operating Range: 1.5 V to 5.5 V
Wide V_L Operating Range: 1.5 V to 5.5 V
- High-Speed with 20 Mb/s Guaranteed Data Rate
- Low Bit-to-Bit Skew
- Enable Input and I/O Pins are Overvoltage Tolerant (OVT) to 5.5 V
- Non-preferential Powerup Sequencing
- Power-Off Protection
- Small Space Saving Package: 1.4 mm x 1.2 mm UQFN8 Package
- These Devices are Pb-Free and are RoHS Compliant

Typical Applications

- I²C, SMBus
- Low Voltage ASIC Level Translation
- Mobile Phones, PDAs, Cameras

Important Information

- ESD Protection for All Pins
 - Human Body Model (HBM) > 6000 V
 - Machine Model (MM) > 400 V

9. AC characteristics are guaranteed by design and are not production tested.

10. Skew is the variation of propagation delay between output signals and applies only to output signals on the same port (I/O_VL_n or I/O_VCC_n) and switching with the same polarity (LOW-to-HIGH or HIGH-to-LOW). Skew is defined by applying a single input to the two input channels and measuring the difference in propagation delays between the output channels.

NLSX4302E

CAPACITANCE ($T_A = 25^\circ\text{C}$)

Symbol	Parameter	Test Condition	Typical	Unit
C_{IN}	Input Capacitance, Control Pin (EN)	$V_L = V_{CC} = \text{GND}$	2	pF
C_{IO}	Input / Output Capacitance ($I/O_VL_n, I/O_VCC_n$)	$V_L = V_{CC} = 5\text{ V}, \text{EN} = \text{GND}, I/O_VL_n = I/O_VCC_n = 5\text{ V}$	3	pF

APPLICATIONS INFORMATION

Level Translator Architecture

The NLSX4302E auto sense translator provides bi-directional voltage level shifting to transfer data in multiple supply voltage systems. This device has two supply voltages, V_L and V_{CC} , which set the logic levels on the input and output sides of the translator. When used to transfer data from the V_L to the V_{CC} ports, input signals referenced to the V_L supply are translated to output signals with a logic level matched to V_{CC} . In a similar manner, the V_{CC} to V_L translation shifts input signals with a logic level compatible to V_{CC} to an output signal matched to V_L .

The NLSX4302E consists of two bi-directional channels that independently determine the direction of the data flow without requiring a directional pin. The one-shot circuits are used to detect the rising or falling input signals. In addition, the one shots decrease the rise and fall time of the output signal for high-to-low and low-to-high transitions. Each input/output channel requires external pullup resistors.

Enable Input (EN)

The NLSX4302E has an Enable pin (EN) that can be used to minimize the power consumption of the device

when the transmitter is not transmitting data. Normal translation operation occurs when the EN pin is equal to a logic high signal. The EN pin is referenced to the V_L supply and has Overvoltage Tolerant (OVT) protection.

Power Supply Guidelines

The sequencing of the power supplies will not damage the device during the power up operation. In addition, the I/O V_{CC} and I/O V_L pins are in the high impedance state if either supply voltage is equal to 0 V. For optimal performance, 0.01 μ F to 0.1 μ F decoupling capacitors should be used on the V_L and V_{CC} power supply pins. Ceramic capacitors are a good design choice to filter and bypass any noise signals on the voltage lines to the ground plane of the PCB. The noise immunity will be maximized by placing the capacitors as close as possible to the supply and ground pins, along with minimizing the PCB connection traces.
