The following user guide supports the FAN9611 300W evaluation board for interleaved boundary-conduction-mode power-factor-corrected supply. It should be used in conjunction with the FAN9611 datasheet, Fairchild application note [AN-6086 —Design Considerations for Interleaved Boundary-Conduction Mode PFC Using FAN9611 / FAN9612](#) and FAN9611/12 PFC Excel®-based Design Tool.

## 1. Overview of the Evaluation Board

The FAN9611 interleaved, dual Boundary-Conduction-Mode (BCM), Power-Factor-Correction (PFC) controllers operate two parallel-connected boost power trains 180° out of phase. Interleaving extends the maximum practical power level of the control technique from about 300W to greater than 800W. Unlike the Continuous Conduction Mode (CCM) technique often used at higher power levels, BCM offers inherent zero-current switching of the boost diodes (no reverse-recovery losses), which permits the use of less expensive diodes without sacrificing efficiency. Furthermore, the input and output filters can be smaller due to ripple current cancellation between the power trains and doubling of effective switching frequency.

The advanced line feed-forward with peak detection circuit minimizes the output voltage variation during line transients. To guarantee stable operation with less switching loss at light load, the maximum switching frequency is clamped at 525kHz. Synchronization is maintained under all operating conditions.

Protection functions include output over-voltage, over-current, open-feedback, under-voltage lockout, brownout, and redundant latching over-voltage protection. FAN9611 is available in a lead-free, 16-lead, Small-Outline Integrated-Circuit (SOIC) package.

This FAN9611 evaluation board uses a four-layer Printed Circuit Board (PCB) designed for 300W (400V/0.75A) rated power. The maximum rated power is 350W and the Maximum On-Time (MOT) power limit is set to 360W. The FEBFAN9611\_S01U300A is optimized to demonstrate all the FAN9611 efficiency and protection features in a low-profile height form factor less than 18mm.

Figure 1. FEBFAN9611\_S01U300A, Top View, 152mm x 105mm

Figure 2. FEBFAN9611\_S01U300A, Side View (Low Profile), Cross Section=18mm

Figure 3. FEBFAN9611\_S01U300A, Bottom View, 152mm x 105mm

## 2. Key Features

- 180° Out-of-Phase Synchronization
- Automatic Phase Disable at Light Load
- 1.8A Sink, 1.0A Source, High-Current Gate Drivers
- Transconductance ( $g_m$ ) Error Amplifier for Reduced Overshoot
- Voltage-Mode Control with  $(V_{IN})^2$  Feed-Forward
- Closed-Loop Soft-Start with Programmable Soft-Start Time for Reduced Overshoot
- Minimum Restart Timer Frequency to Avoid Audible Noise
- Maximum Switching Frequency Clamp
- Brownout Protection with Soft Recovery
- Non-Latching OVP on FB Pin and Second-Level Latching Protection on OVP Pin
- Open-Feedback Protection
- Over-Current and Power-Limit Protection for Each Phase
- Low Startup Current: 80 $\mu$ A Typical
- Works with DC input or 50Hz to 400Hz AC Input

Figure 4. Block Diagram

### 3. Specifications

This evaluation board has been designed and optimized for the conditions in Table 1.

**Table 1. Electrical and Mechanical Requirements**

	<b>Min.</b>	<b>Typ.</b>	<b>Max.</b>
$V_{IN\_AC}$	80V	120V	265V
$V_{IN\_AC(ON)}$		90V	
$V_{IN\_AC(OFF)}$		80V	
$f_{VIN\_AC}$	50Hz	60Hz	65Hz
$V_{OUT\_PFC}$	395V	400V	405V
$V_{OUT\_PFC\_RIPPLE}$		10V	11V
$P_{OUT\_PFC}$		300W	350W
$P_{OUT\_PFC(MOT\ LIMIT)}$		360W	
$f_{SW\_PFC}$	18kHz		300kHz
$t_{HOLD\_UP}$	20ms		
$t_{SOFT\_START}$		250ms	300ms
$t_{ON\_OVERSHOOT}$			10V
$\eta_{PFC\_120V}$ $P_{OUT} > 30\% P_{OUT(TYP)}$		96%	96.5%
$\eta_{PFC\_230V}$ $P_{OUT} > 30\% P_{OUT(TYP)}$		95%	98%
$PF_{120V}$			0.991
$PF_{230V}$			0.980
<b>Mechanical and Thermal</b>			
Height			18mm
$\theta_{JC}$			60°C

The trip points for the built-in protections are set as below in the evaluation board.

- The line UVLO (brownout protection) trip point is set at 80V<sub>AC</sub> (10V<sub>AC</sub> hysteresis).
- The pulse-by-pulse current limit for each MOSFET is set at 6A.

The current-limit function can be observed by measuring the individual inductor current waveforms while operating at 85V<sub>AC</sub> and increasing the load to 360W. The maximum power limit is set at ~120% of the rated output power. The power-limit function can be observed while operating at >115V<sub>AC</sub> and increasing the load beyond 360W. When operating in power limit, the output voltage drops and the COMP voltage is saturated, but the AC line current remains sinusoidal. The phase-management function permits phase shedding / adding ~18% of the nominal output power for high line (230V<sub>AC</sub>). This level can be increased by modifying the MOT resistor (R6) as described in Fairchild Application Note [AN-6086 —Design Considerations for Interleaved Boundary-Conduction Mode PFC Using FAN9611 / FAN9612.](#)

## 4. Test Procedure

Before applying power to the FEBFAN9611\_S01U300A evaluation board; the DC bias supply for  $V_{DD}$ , AC voltage supply for line input, and DC electronic load for output should be connected to the board as shown in Figure 5.

**Table 2. Specification Excerpt from FAN9611 Datasheet**

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
<b>Supply</b>						
$I_{STARTUP}$	Startup Supply Current	$V_{DD} = V_{ON} - 0.2V$		80	110	$\mu A$
$I_{DD}$	Operating Current	Output Not Switching		3.7	5.2	mA
$I_{DD\_DYM}$	Dynamic Operating Current	$f_{SW} = 50kHz$ ; $C_{LOAD} = 2nF$		4	6	mA
$V_{ON}$	UVLO Start Threshold	$V_{DD}$ Increasing	9.5	10.0	10.5	V
$V_{OFF}$	UVLO Stop Threshold Voltage	$V_{DD}$ Decreasing	7.0	7.5	8.0	V
$V_{HYS}$	UVLO Hysteresis	$V_{ON} - V_{OFF}$		2.5		V

### 4.1. Safety Precautions

The FEBFAN9611\_S01U300A evaluation module produces lethal voltages and the bulk output capacitors store significant charge. Please be extra careful when probing and handling the module and observe a few precautions:

- Start with a clean working surface, clear of any conductive material.
- Be careful while turning on the power switch to the AC source.
- Never probe or move a probe on the DUT while the AC line voltage is present.
- Ensure the output capacitors are discharged before disconnecting the test leads. One way to do this is to remove the AC power with the DC output load still switched on. The load then discharges the output capacitors and the module is safe to disconnect.

#### Power-On Procedure

1. Supply  $V_{DD}$  for the control chip first. It should be higher than 10.5V (refer to the specification for  $V_{DD}$  turn-on threshold voltage in Table 2).
2. Connect the AC voltage (90~265V<sub>AC</sub>) to start the FAN9611 evaluation board. Since FAN9611 has brownout protection, any input voltage less than the designed minimum AC line voltage triggers brownout protection. FEBFAN9611\_S01U300A does not start until the AC input voltage is greater than 90V<sub>AC</sub>.
3. Change load current (0~0.75A) and check the operation
4. Verify the output voltage is regulating between 395V<sub>DC</sub><V<sub>OUT</sub><405V<sub>DC</sub>

**Figure 5. Recommended Test Set-Up**

All efficiency data shown in this document was taken using the test set up shown in Figure 5 with the output voltage being measured directly at the output bulk capacitors (not through the output connector (J2)).

#### Power-Off Procedure

1. Make sure the electronic load is set to draw at least 100mA of constant DC current.
2. Disconnect (shut down) AC line voltage source.
3. Disconnect (shut down) 12V DC bias power supply.
4. Disconnect (shut down) DC electronic load last to ensure that the output capacitors are fully discharged before handling the evaluation module.

## 6. Boost Inductor Specification

750340834 from Wurth Electronics ([www.we-online.com](http://www.we-online.com))

- Core: EFD30 ( $A_c=69\text{mm}^2$ )
- Bobbin: EFD30
- Inductance :  $270\mu\text{H}$

Table 4. Inrush Current Limiting Circuit Effectiveness Comparison

Input Line Voltage	Output Power	Peak Line Current (Inrush Circuit Disabled)	Peak Line Current (Inrush Circuit Enabled)	% Inrush Current Reduction
V <sub>IN</sub> =115V <sub>AC</sub>	300W	22.50A <sub>PK</sub>	8.45A <sub>PK</sub>	62.40%
V <sub>IN</sub> =230V <sub>AC</sub>	300W	26.9A <sub>PK</sub>	11.5A <sub>PK</sub>	57.3%

## 10. Test Results

### 10.1. Startup

Figure 17 and Figure 18 show the startup operation at 115V<sub>AC</sub> line voltage for no-load and full-load condition, respectively. Due to the closed-loop soft-start, almost no overshoot is observed for no-load startup and full-load startup.

**Figure 17. No-Load Startup at 115V<sub>AC</sub>**

**Figure 18. Full-Load Startup at 115V<sub>AC</sub>**

Figure 19 and Figure 20 show the startup operation at 230V<sub>AC</sub> line voltage for no-load and full-load conditions, respectively. Due to the closed-loop soft-start, almost no overshoot is observed for no-load startup and full-load startup.

**Figure 19. No-Load Startup at 230V<sub>AC</sub>**

**Figure 20. Full-Load Startup at 230V<sub>AC</sub>**

## 10.2. Steady-State Operation

Figure 21 and Figure 22 show the two inductor currents and the sum of the two inductor currents operating at full load for 90V<sub>AC</sub> and 230V<sub>AC</sub> line voltage. The sum of the inductor currents has relatively small ripple due to the ripple cancellation of interleaving.

### 10.3. Line Transient

Figure 29 and Figure 30 show the line transient operation and minimal effect on output voltage due to the line feed-forward function. When the line voltage changes from 230V<sub>AC</sub> to 115V<sub>AC</sub>, about 20V (5% of nominal output voltage) voltage undershoot is observed. When the line voltage changes from 115V<sub>AC</sub> to 230V<sub>AC</sub>, about 6V (1.5% of nominal output voltage) voltage overshoot is observed.

Figure 29. Line Transient Response at Full-Load Condition (230V<sub>AC</sub> → 115V<sub>AC</sub>)

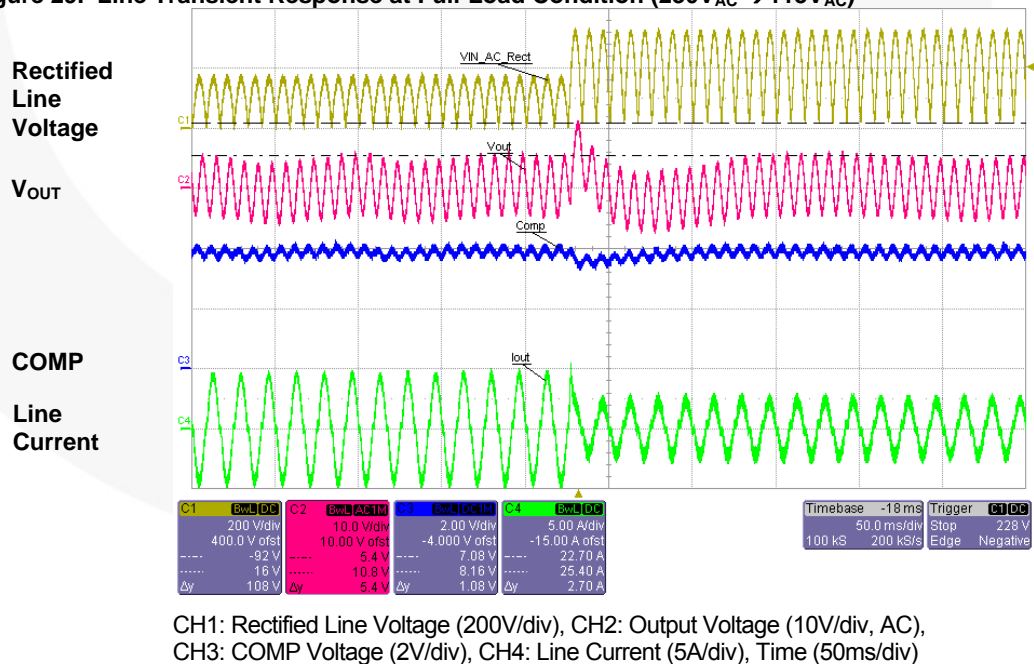

Figure 30. Line Transient Response at Full-Load Condition (115V<sub>AC</sub> → 230V<sub>AC</sub>)

## 10.4. Load Transient

Figure 31 and Figure 32 show the load-transient operation. When the output load changes from 100% to 0%, 20V (5% of nominal output voltage) voltage overshoot is observed. When the output load changes from 0% to 100%, 34V (8.5% of nominal output voltage) voltage undershoot is observed.

CH1: Rectified Line Voltage (100V/div), CH2: Output Voltage (20V/div, AC), CH3: COMP Voltage (2V/div), CH4: Line Current (5A/div), Time (50ms/div)

**Figure 31. Load Transient Response at 115V<sub>AC</sub> (Full Load → No Load)**

Figure 34. Load Transient Response at 230V<sub>AC</sub> (No Load → Full Load)

## 10.5. Brownout Protection

Figure 35 shows the startup operation while slowly increasing the line voltage. The power supply starts up when the line voltage reaches around 90V<sub>AC</sub>. Figure 36 shows the shutdown operation while slowly decreasing the line voltage. The power supply shuts down when the line voltage reaches around 80V<sub>AC</sub>.

CH1: Line Voltage (100V/div), CH2: Gate Drive 1 Voltage (10V/div),  
CH4: Line Current (5A/div), Time (200ms/div)

**Figure 35. Startup Slowly Increasing the Line Voltage**

CH4: Line Current (5A/div), Time (20ms/div)

**Figure 36. Shutdown Slowly Decreasing the Line Voltage**

## 10.6. Phase Management

Figure 37 and Figure 38 show the phase-shedding waveforms. As observed, when the gate drive signal of Channel 2 is disabled, the duty cycle of Channel 1 gate drive signal is doubled to minimize the line current glitch and guarantee smooth transient.

**Figure 37. Phase-Shedding Operation**

**Figure 38. Phase-Shedding Operation (Zoomed-in Timescale)**

Figure 39 and Figure 40 show the phase-adding waveforms. As observed, just before the Channel 2 gate drive signal is enabled, the duty cycle of Channel 1 gate drive signal is reduced by 50% to minimize the line current glitch and guarantee smooth transient. In Figure 40, the first pulse of gate drive 2 during the phase-adding operation is skipped to ensure 180° out-of-phase interleaving operation during transient.

CH1: Gate Drive 1 Voltage (20V/div), CH2: Gate Drive 2 Voltage (20V/div),  
CH3: Inductor L1 Current (1A/div), CH4: Inductor L2 Current (1A/div), Time (5ms/div)

**Figure 39. Phase-Adding Operation**

CH1: Gate Drive 1 Voltage (20V/div), CH2: Gate Drive 2 Voltage (20V/div),  
CH3: Inductor L1 Current (1A/div), CH4: Inductor L2 Current (1A/div), Time (5µs/div)

**Figure 40. Phase-Adding Operation (Zoomed-in Timescale)**

## 10.7. Efficiency

Figure 41 and Figure 42 show the measured efficiency of the 300W evaluation board with  $R_{MOT}=60.4k\Omega$  at input voltages of  $115V_{AC}$  and  $230V_{AC}$ . The phase management threshold on the test evaluation board is approximately 15% of the nominal output power. The threshold can be adjusted upwards to achieve a more desirable efficiency profile by increasing the MOT resistor. Figure 43 and Figure 44 show the light-load efficiency improvement that can be achieved when the threshold is adjusted to 30% by increasing the MOT resistor to  $120k\Omega$ .

Since phase shedding reduces the switching loss by effectively decreasing the switching frequency at light load, greater efficiency improvement is achieved at  $230V_{AC}$ , where switching losses dominate. Relatively less improvement is obtained at  $115V_{AC}$ , since the MOSFET is turned on with zero voltage and switching losses are negligible. The efficiency measurements include the losses in the EMI filter, cable loss and power consumption of the control IC.

Figure 41. Efficiency vs. Load (115V<sub>AC</sub>)

Figure 42. Efficiency vs. Load (230V<sub>AC</sub>)

Figure 43. Efficiency vs. Load (115V<sub>AC</sub>)

Figure 44. Efficiency vs. Load (230V<sub>AC</sub>)

Figure 45 and Figure 46 show a direct comparison of light-load efficiency benefit gained when increasing the MOT resistor. For  $R_{MOT}=120k\Omega$ , the phase threshold is adjusted upward from 18% to approximately 30% of nominal maximum output power. It is not recommended to adjust the phase threshold near the 50% nominal maximum output power, since each individual BCM PFC channel is optimally designed to process 50% (plus 20% margin) of the total output power required by the load.

**Figure 45. Efficiency vs. Load (115V<sub>AC</sub>)**

**Figure 46. Efficiency vs. Load (230V<sub>AC</sub>)**

The FEBFAN9611\_S01U300A evaluation board is configured with  $R_{MOT}=60.4k\Omega$ , which sets the maximum output power limit to about 360W. Because of the highly optimized, low-profile cross-section of this design; the EFD30 inductors are not rated to process more than 200W each (400W total output power). When the MOT resistor is increased to 120k $\Omega$ , the maximum allowable output power is also increased to greater than 400W. To fully protect the power stage, a simple voltage divider and PNP clamp should be applied to the FAN9611 COMP voltage (pin 7) as detailed in [AN-6086](#), Figure 15.

## 10.8. Harmonic Distortion and Power Factor

Figure 47 and Figure 48 compare the measured harmonic current with EN61000 Class D and Class C, respectively, at input voltages of 115V<sub>AC</sub> and 230V<sub>AC</sub>. Class D is applied to TV and PC power, while Class C is applied to lighting applications. As can be observed, both regulations are met with sufficient margin.

Figure 47. Harmonic Current, 115V<sub>AC</sub>

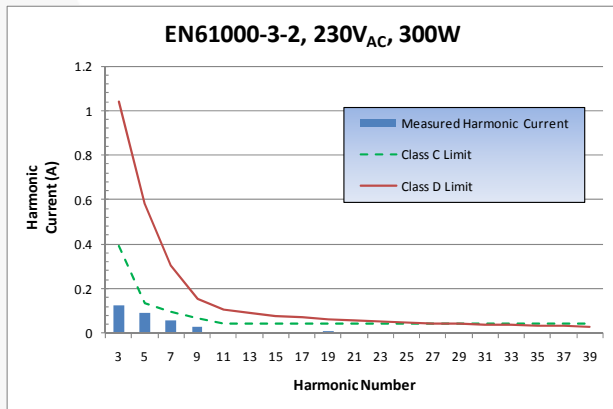

Figure 48. Harmonic Current, 230V<sub>AC</sub>

Figure 49. Measured Power Factor

Figure 50. Measured Total Harmonic Distortion

Figure 49 shows the measured power factor at input voltage of 115V<sub>AC</sub> and 230V<sub>AC</sub>. As observed, high power factor above 0.95 is obtained from 100% to 50% load. Figure 50 shows the total harmonic distortion at input voltages of 115V<sub>AC</sub> and 230V<sub>AC</sub>.

## 10.9. EMI

Orderable Part Number	Description
FEBFAN9611_S01U300A	FAN9611 300W Evaluation Board

## 13. Revision History

Date	Revision	Description
February 2012	0.0.1	Initial release

### WARNING AND DISCLAIMER

Replace components on the Evaluation Board only with those parts shown on the parts list (or Bill of Materials) in the Users' Guide. Contact an authorized Fairchild representative with any questions.

This board is intended to be used by certified professionals, in a lab environment, following proper safety procedures. Use at your own risk. The Evaluation board (or kit) is for demonstration purposes only and neither the Board nor this User's Guide constitute a sales contract or create any kind of warranty, whether express or implied, as to the applications or products involved. Fairchild warrants that its products meet Fairchild's published specifications, but does not guarantee that its products work in any specific application. Fairchild reserves the right to make changes without notice to any products described herein to improve reliability, function, or design. Either the applicable sales contract signed by Fairchild and Buyer or, if no contract exists, Fairchild's standard Terms and Conditions on the back of Fairchild invoices, govern the terms of sale of the products described herein.

#### DISCLAIMER

FAIRCHILD SEMICONDUCTOR RESERVES THE RIGHT TO MAKE CHANGES WITHOUT FURTHER NOTICE TO ANY PRODUCTS HEREIN TO IMPROVE RELIABILITY, FUNCTION, OR DESIGN. FAIRCHILD DOES NOT ASSUME ANY LIABILITY ARISING OUT OF THE APPLICATION OR USE OF ANY PRODUCT OR CIRCUIT DESCRIBED HEREIN; NEITHER DOES IT CONVEY ANY LICENSE UNDER ITS PATENT RIGHTS, NOR THE RIGHTS OF OTHERS.

#### LIFE SUPPORT POLICY

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF FAIRCHILD SEMICONDUCTOR CORPORATION.

As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, or (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness

### ANTI-COUNTERFEITING POLICY

Fairchild Semiconductor Corporation's Anti-Counterfeiting Policy. Fairchild's Anti-Counterfeiting Policy is also stated on our external website, [www.fairchildsemi.com](http://www.fairchildsemi.com), under Sales Support.

Counterfeiting of semiconductor parts is a growing problem in the industry. All manufacturers of semiconductor products are experiencing counterfeiting of their parts. Customers who inadvertently purchase counterfeit parts experience many problems such as loss of brand reputation, substandard performance, failed applications, and increased cost of production and manufacturing delays. Fairchild is taking strong measures to protect ourselves and our customers from the proliferation of counterfeit parts. Fairchild strongly encourages customers to purchase Fairchild parts either directly from Fairchild or from Authorized Fairchild Distributors who are listed by country on our web page cited above. Products customers buy either from Fairchild directly or from Authorized Fairchild Distributors are genuine parts, have full traceability, meet Fairchild's quality standards for handling and storage and provide access to Fairchild's full range of up-to-date technical and product information. Fairchild and our Authorized Distributors will stand behind all warranties and will appropriately address any warranty issues that may arise. Fairchild will not provide any warranty coverage or other assistance for parts bought from Unauthorized Sources. Fairchild is committed to combat this global problem and encourage our customers to do their part in stopping this practice by buying direct or from authorized distributors.

### EXPORT COMPLIANCE STATEMENT

These commodities, technology, or software were exported from the United States in accordance with the Export Administration Regulations for the ultimate destination listed on the commercial invoice. Diversion contrary to U.S. law is prohibited.

U.S. origin products and products made with U.S. origin technology are subject to U.S. Re-export laws. In the event of re-export, the user will be responsible to ensure the appropriate U.S. export regulations are followed.
