

High Efficiency DC-DC Converter Module

ON Semiconductor

Device	Application	Input Voltage	Output Power	Topology	I/O Isolation
NCP12700	Module	9 to 36 Vdc	Up to 15 W	CCM/DCM Flyback	Isolated

Output Specification	
Output Voltage	12 Vdc nominal
Nominal Current	1.25 A
Full Load Efficiency	> 87%
Startup Time	< 30 ms
Over Power Protection	120 % - 150 %
Over Voltage Protection	16 Vdc

Circuit Description

The NCP12700 is fixed frequency, peak current mode PWM controller for single-ended switch mode power supplies (SMPS). Among its many features are a best-in-class startup linear regulator; programmability of switching frequency, soft start, and over-power protection; fully integrated slope compensation, and multiple protection functions necessary for designing efficient industrial, telecom, and transportation DC-DC power supplies with a minimum number of external components.

This design note describes a 12 V, 15 W flyback SMPS developed with the NCP12700BDNR2G controller. The SMPS operates from an input voltage range of 9 – 36 V while achieving greater than 87% full load efficiency. The SMPS was designed to operate in both continuous and discontinuous conduction mode depending on load current and input voltage.

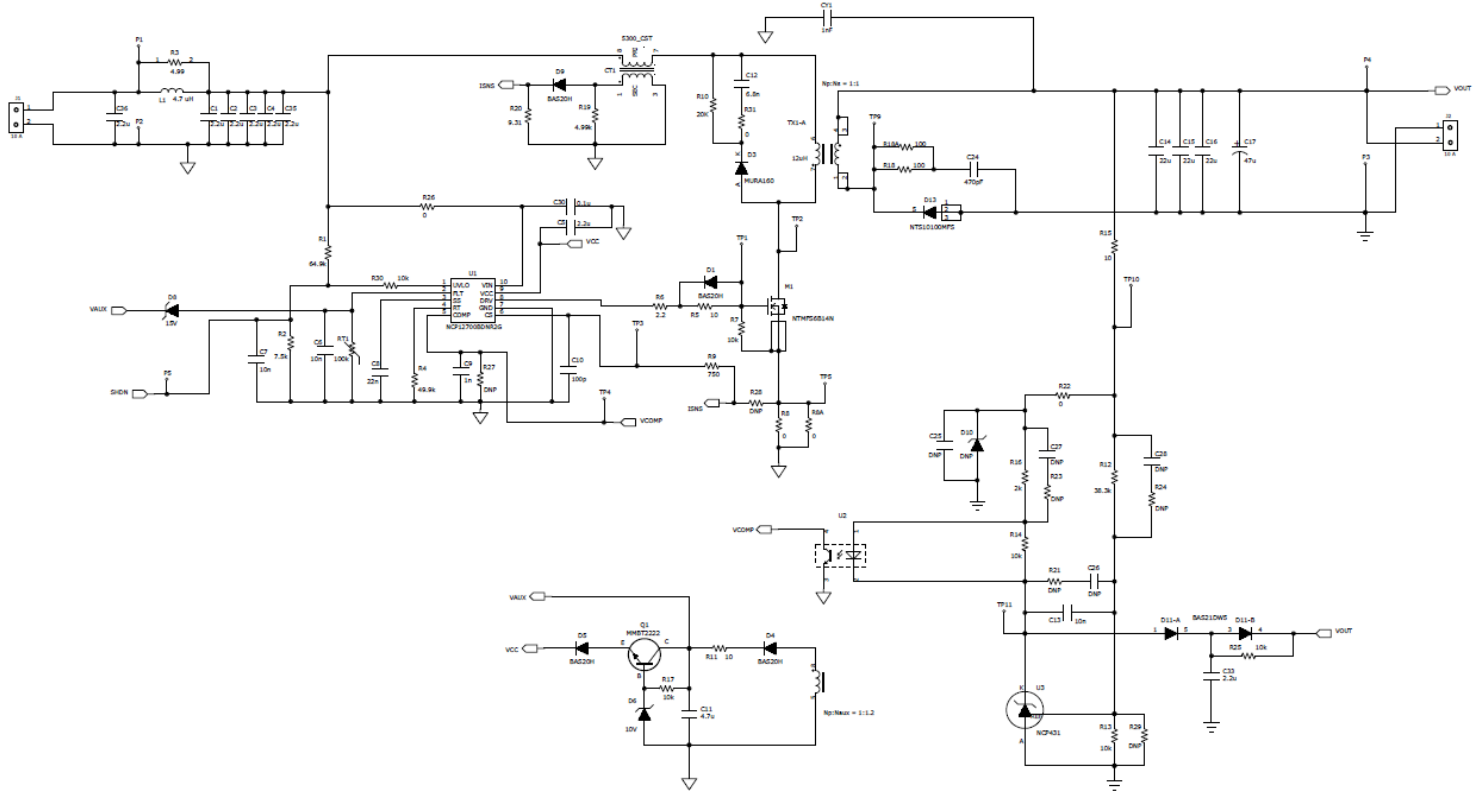

A full circuit schematic, bill of materials, transformer design details, and PCB artwork are provided. The design note also contains multiple operational waveforms and performance data highlighting the features and capabilities of the NCP12700.

Key Features

- Wide Input Range (9 – 120/200 V; MSOP10/WQFN10) Startup Regulator
- Startup Regulator Circuit capable of sourcing a minimum of 15 mA
- Programmable Over-Power Protection
- Integrated Slope Compensation
- Fault Input for Over Temperature and Output Over Voltage Fault Conditions, NTC Compatible
- 1 A / 2.8 A Source / Sink Gate Driver
- Programmable Soft Start
- Overload Protection with 30 ms Timer and 1 s Auto-recovery

INDUCTANCE	7-6 10kHz, 100mV, Ls	12.0µH ±10%
SATURATION CURRENT	7-6 20% rolloff from initial	9.5A
LEAKAGE INDUCTANCE	7-6 tie(1+2+3+4, 5+8), 100kHz, 10mV, Ls	100nH typ., 250nH max.
DIELECTRIC	1-8 tie(3+4, 5+6), 2250VAC, 1 second	1800VAC, 1 minute
DIELECTRIC	5-7 625VAC, 1 second	
TURNS RATIO	(8-5):(7-6)	1.2:1, ±1%
TURNS RATIO	(8-5):(4-1), tie(1+2, 3+4)	1.2:1, ±1%

Application of the transformer allows for the leadwires between terminals 1&2 and 3&4 to solder bridge.

Customer to tie terminals 1&2 and 3&4 on PC board.

GENERAL SPECIFICATIONS:

OPERATING TEMPERATURE RANGE: -40°C to +125°C including temp rise.

Designed to comply with the following requirements as defined by IEC60950-1, EN60950-1, UL60950-1/CSA60950-1 and AS/NZS60950.1:

- Functional insulation for a primary circuit at a working voltage of 265Vrms, 400Vpeak, Overvoltage Category II.

Description of Key Features

1. High Voltage Startup Regulator

Figures 3: Startup Regulator Operation

Startup Regulator Operation
 Ch. 1 (Yellow): VIN
 Ch. 2 (Blue): VCC
 Ch. 3 (Purple): VOUT
 Ch. 4 (Green): DRV

The NCP12700 features a high voltage startup regulator capable of operating from input voltages ranging from 9 – 200 V. The regulator is capable of sourcing > 15 mA with as little as 2 V of overhead. A capacitor in the range 1 – 10 μ F at the V_{CC} pin is recommended to ensure stability of the regulator. The input operating range, source current capability, and stability requirements of the regulator were designed for best-in-class performance providing the user with fast startup capability and requiring no additional components for ease of design. The regulator's drive capability ensures that the device can continue to self-bias for the duration of the startup period easing the design of the auxiliary winding. Once the application is in regulation it is recommended that an auxiliary winding from the power transformer be utilized for biasing of the supply to reduce the thermal stress on the controller.

The startup waveforms for the DC-DC Module at 9 and 36 V are shown in Figure 3. The V_{CC} voltage is quickly charged to 8 V, enabling switching of the application within 2.5 ms of the input power being applied. The application module reaches regulation in less than 25 ms and no voltage drop is observed on V_{CC} demonstrating the source capability of the regulator.

2. Input Over-Power Compensation

In wide input range power supplies the power delivery capability tends to increase at higher line voltages presenting thermal challenges for the supply designer. The NCP12700 features an integrated input over-power protection feature for limiting the output power capability of the application at higher line voltages. Shown in the Figure 4, the controller tracks an image of the input line voltage through the UVLO pin and sources current out of the current sense pin as the UVLO pin voltage increases. A series resistor between the CS pin at the controller and the current sensing element creates an offset voltage reducing the available peak current in the power supply and thereby reducing the power delivery capability. The current out of the CS pin has been limited to 200 μ A allowing the designer to utilize the series resistor commonly included for high frequency filtering of the CS signal.

Figure 4: Over Power Protection Circuit

Figure 5: Over Power Protection Waveform

- Ch. 1 (Yellow): COMPV_{CC}
- Ch. 2 (Blue): CS @ Pin
- Ch. 3 (Purple): CS @ R_{SNS}
- Ch. 4 (Green): DRV

The waveform in Figure 5 demonstrates the offset voltage and reduced peak current capability in the demonstration board. The waveform in blue shows how the current sense voltage at the controller is increased relative to the voltage across the current sensing element.

DN05108/D

The plot in Figure 6 shows the power supply overload current as a function of input voltage. The available overload current is practically constant across the input voltage showing the benefit of the over-power protection feature.

Figure 6: Overload Current vs Input Voltage

3. Slope Compensation

Peak current mode controlled power supplies are susceptible to subharmonic oscillations when operating in continuous conduction mode at higher duty cycles. The NCP12700 features fully integrated slope compensation effective for damping out the oscillations and ensuring a stable operating power supply. Figure 7 illustrates the basic principle of the integrated slope compensation in the NCP12700. A voltage ramp is subtracted from the drive terminating signal of a comparator in the PWM reset path. The ramp begins subtracting from the signal at a 40% duty cycle and ends at the 80% maximum duty cycle limit with a peak subtraction of 100 mV. The slope compensation is applied to both the PWM and Current Limit comparator ensuring stable operation regardless of the drive terminating comparator. The waveform in Figure 8 illustrates the compensating slope while showing the CS and COMP pin waveforms. The power supply operating in CCM at 60% duty cycle is in stable operation with no indication of subharmonic oscillation.
