Introduction

This document describes the NCV7383EVB Evaluation board for the ON Semiconductor NCV7383 FlexRay Bus Driver. The functionality and major parameters can be evaluated with the NCV7383EVB board.

The NCV7383 is a single-channel FlexRay bus driver compliant with the FlexRay Electrical Physical Layer Specification Version 3.0.1, capable of communicating at speeds of up to 10 Mb/s. It provides differential transmit and receive capability between a wired FlexRay communication medium on one side and a protocol controller and a host on the other side.

NCV7383 mode control functionality is optimized for nodes without the need of extended power management provided by transceivers with permanent connection to the car battery as is on NCV7381.

NCV7383 is primarily intended for nodes switched off by ignition. Additional details can be found in the NCV7383 datasheet.

Figure 1. Evaluation Board Photo

The NCV7383EVB Evaluation board is a reference design for stand-alone 2-channel FlexRay node. The board is intended to give designers easy, quick and convenient means for evaluation of NCV7383 FlexRay bus drivers. The design incorporates complete node solution with possibility of modifications and small board size. A set of two boards allows users immediately start with the NCV7383 FlexRay Bus Driver. The MCU is preprogrammed with a firmware which provides simple mode control and FlexRay communication. With use of Freescale™ BDM programmer and a suitable development environment, the MCU firmware can be freely modified and reprogrammed.

Figure 2. NCV7383 Pin Connections

Board Hardware

The board consists of MCU with integrated 2-channel FlexRay communication controller interconnected with two separate FlexRay bus drivers (NCV7383), two voltage regulators and peripherals. The board is prepared for various modifications in power supply concept and FlexRay bus termination, and allows simple extension of the system by unused MCU pins. USB interface provides compatibility with standard PC. The address of each board can be easily modified by address switch what allows to create complex FlexRay network without the need of reprogramming the MCU. Implemented High Speed CAN interface can be used as a diagnostic interface in a network built from several nodes. For evaluation purposes NCV7383 is populated with several LED diodes and most of the bus driver signals are comfortable accessible to oscilloscope probes.
NCV73830V1GEVB

GENERAL FEATURES

**FlexRay Transceiver**
- Two separate FlexRay channels with NCV7383 Bus Driver compliant with the FlexRay Electrical Physical Layer Specification Version 3.0.1,
- Reconfigurable bus termination – End node / Middle node
- Common mode Choke and additional ESD protection footprint
- SUBD-9 connectors – FlexRay bus

**MCU**
- Freescale™ 16-bit MC9S12XF family MCU
- Integrated FlexRay Communication Controller (Protocol Specification Rev. 2.1)
- Integrated CAN 2.0 A, B Controller
- Background Debug Module – single-wire communication with host development system
- 512 k byte Flash
- 32 k byte RAM
- 50 MHz maximum CPU bus frequency
- Relatively small 112-pin LQFP package

**Peripherals**
- Optical isolated USB interface (USB to UART converter)
- Additional CAN interface

- All NCV7383 digital I/O pins connected to test points – easy connection to Logic Analyzer
- 8 general purpose LEDs
- Address switch
- External Interrupt switch

**Other**
- Two Automotive Voltage regulators (Input battery voltage up to 42 V)
- Power supplies voltage monitoring
- Instant 2-nodes FlexRay network with running communication by connecting two NCV7383 EVBs.
- PC configuration software under development (available upon request)

**PCB Layout**
- The FlexRay transceiver, the ESD protection and the common mode choke are placed near to the FlexRay the ECU connector
- The FlexRay signal lines (BP, BM) are decoupled from disturbances on the ECU board
- The routing of the FlexRay lines (BP, BM, TxD and TxEN) is symmetric
- The distance between the lines BP and BM resp. TxD and TxEN is minimized

GETTING STARTED

The NCV7383EVB board is fully assembled, pre-programmed and can be immediately used for evaluation. Only a few steps need be proceeded to get fully working simple FlexRay network.

Connect the evaluation boards as follows:
1. Set the boards to default configuration according to Jumpers and Default Configuration section.
2. Select one of the bus termination type (Bus Termination Configuration section) and adapt the respective devices. End node termination type is recommended for 2-node network.
3. Set a different board address on each board. One of the boards must be set with address 1 and is considered as Master Board. Node address is configured by address switch SW12 – see Address Switch for details.
4. Connect the boards according to Figure 3. Up to 5 boards with addresses 1 to 5 can be connected together.
5. Connect the oscilloscope to any test-point as needed.
6. When power supply is applied, MCU automatically configures the FlexRay Communication Controller setting based on the current node address and initiates FlexRay communication.
Power Modes

The nodes can operate in two different power modes:

- **Normal mode** – all the nodes continuously communicates over the FlexRay bus.
- **Standby mode** – the communication is suspended. Both NCV7383 FlexRay transceivers are switched to Low Power Standby operating mode. Indication LEDs are switched off. The MCU is operating in low power STOP mode where the oscillator is stopped and the current consumption is substantially reduced.

Enter Standby Mode Sequence

A transition to Standby mode can be initiated by the node with address 1:

- Press and hold the Node1 #IRQ button for more than 3 seconds. The GO_TO_STANDBY signal is transmitted over the FlexRay bus. All the nodes then synchronously stop the communication and switch to Standby mode.

Wakeup Sequence

The network operating in Standby mode can be woken-up by any node:

- Press the #IRQ button on any node connected to the network. The MCU is woken-up from STOP mode by an external interrupt (#IRQ button pressed), resume operation in Normal mode and automatically wake up the rest of the network by the FlexRay Remote Wakeup Pattern sent over the bus. Once all the nodes are initialized, the FlexRay communication is restarted.

Normal Mode LED Signaling

The properly running setup should signal following (Figure 4):

- **LEDs 8 - LED 4**  Toggling LED signals data was received correctly in the particular slot (Slot 1 – Slot 5)
- **LED 3**  Each node transmits its own #IRQ Button status (BTN_IRQ_DOWN signal). This LED signals that one of the nodes in the network detected the #IRQ button pressed.
- **LED 2**  When the #IRQ button is pressed and held down, the LED 2 is gradually decreasing intensity indicating the time remaining to ENTER STANDBY MODE event (100% to 0% in 2.4 seconds).
- **LED 1**  LED1 changes intensity according to input battery voltage.
- The LED intensity is directly proportional to the battery voltage in range of 10 V to 14V.
· Battery voltage being below 10 V is indicated by LED1 OFF state.
· Battery voltage exceeding 14 V is indicated by LED1 full intensity (Figure 5).

**Figure 5. LED1 Intensity vs. Battery Voltage**

---

**Standby Mode LED Signaling**
In Standby mode, all the LEDs except LED8 are switched OFF. The LED8 is turned ON with very low intensity, signaling the MCU is correctly operating in the low power STOP mode and is ready to be woken-up.

**FlexRay Communication Cycle Configuration**
- Cycle Length: 10000 us
- Number of Static Slots: 10 (5 slots active)
- Static Slot Length: 31 us
- Static Slot Payload Length: 6 Words
- Dynamic Segment: Not used
- Symbol Window Length: 14 us

Each node is assigned to one communication slot. The Slot number corresponds to particular Node address.

**Figure 6. FlexRay Communication Cycle Configuration (Tx – Transmitter Buffer, Rx – Receive Buffer)**
Basic Interface

**Legend:**

**Power Supply Input Connector**
Power supply input socket. Plug diameter 2.1 mm, length 14 mm. Maximum input voltage 42 V (Limited by onboard voltage regulators input voltage range).

**Figure 8. Power Supply Input Connector**

**Aux Digital I/O Connector**
These pin header contains 8 auxiliary MCU signals – one complete SPI interface (4 pins), one UART interface (2 pins) and 2 signals connected to MCU ADC interface. These signals can be also used as general Input / Output signals for debugging or other purposes.

**Figure 9. Aux Digital I/O Connector**

**CAN Backbone Connectors**
CAN backbone network is created as parallel connection of several boards. Each board contains two equivalent
connectors in parallel, so whole network can be prepared using only simple point-to-point twisted pair.

Figure 10. CAN Backbone Connectors

USB Interface
Standard B type USB socket is used for connection to PC. USB interface is bus powered and electrically isolated from the rest of the board, so it is not possible to supply this board via USB.

FlexRay CC Strobe Output Signals
The MCU FlexRay block provides a number of strobe signals for observing internal protocol timing related signals in the protocol engine.

Figure 11. FlexRay CC Strobe Output Signals

BDM Connector (MCU Debugging Interface)
The BDM module provides a single-wire communication with host development system (Programming and debugging interface).

Figure 12. BDM Connector

FlexRay BD Digital Signals Test Points Headers
These headers are intended to be used as a test points for digital probes. Headers contain all FlexRay BD digital input and output signals.
Test points for both FlexRay channel A and channel B are placed on separated headers (J73 – channel A, J83 – channel B).

FlexRay BD Analog Signals Test Points
There are 6 analog test points on the board:
- BP – FlexRay Bus Plus terminal (Channel A)
- BM – FlexRay Bus Minus terminal (Channel A)
- VIO – Bus Driver VIO Power Supply input
- BP – FlexRay Bus Plus terminal (Channel B)
- BM – FlexRay Bus Minus terminal (Channel B)
- VCC – Bus Driver VCC Power Supply input

FlexRay Bus Connectors
FlexRay EPL Specification [2] does not prescribe certain connectors for FlexRay systems. Common used 9-pin D-Sub connectors were chosen as a suitable connector, whose electrical characteristics satisfy the specification.

Switches and Pushbuttons

- SW10...MCU Reset button
- SW11...MCU External interrupt button
- SW12...8-way DIP switch. The function depends on the MCU program. As default it is used for setting a node address.
Address Switch
This switch is used for setting a node number. Each board is programmed with the same firmware, so every node in the network must be configured with different unique number. Be careful:

- LSB is situated on the left.
- ON means the particular switch is closed and output is Logical 0!
- OFF means the particular switch is open and output is Logical 1!

The switch configuration shown in this figure means binary 0b00000010 (Node address is set to 2).

MCU Reset Button
This button is connected directly to MCU RESET pin.

MCU External Interrupt Button
The MCU interrupt module support one maskable interrupt input. This input is connected to SW11.

LEDs
Three power LEDs indicate proper function of voltage regulators. In case the MCU and the NCV7381 bus drivers IO cells use the same power supply (as by default) MCU VCC LED and BD VIO LED signalling is also the same.

The board contains a bank of eight general purpose LEDs (Green). Their function depends on the MCU program.

There is also USB indication LED which is used to signal ongoing USB data transmission.

1. Tolerance ±1%, type 0805. The value $R_{BUS1} + R_{BUS2}$ should match the nominal cable impedance.
2. Tolerance ±20%, type 0805.

SPECIFICATIONS

Power Supply
The Evaluation board can be powered either via DC power supply input socket with plug diameter 2.1 mm and length 14 mm or by one of the FlexRay bus connectors (See the connector description Table 1). Maximum input voltage (42 V) is limited by on-board voltage regulators input voltage range.

Split Termination
In order to achieve a better EMC performance, it is recommended to make use of a so-called split termination in all ECUs, where the Termination resistance $R_T$ is split into two equal parts $R_{TA}$ and $R_{TB}$ [2].

![Figure 22. ECU with Split Termination][2]

The serial RC combination ($R_1; C_1$) at the centre tap of the split termination provides a termination to GND for common mode signals. $R_1$ is preferably omitted. Typical values are given in the following table:

Table 7. TERMINATION PARAMETERS

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Typ</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>$R_1$</td>
<td>Resistor</td>

<td>pF</td>
</tr>
<tr>
<td>$2 \times</td>
<td>\frac{</td>
<td>R_{TA} - R_{TB}</td>
<td>}{(R_{TA} + R_{TB})}$</td>
</tr>
</tbody>
</table>

For $R_{TA}$ and $R_{TB}$ the use of 1% tolerated resistors leads to a matching of 2%.

The better the matching of the split termination resistors $R_{TA}$ and $R_{TB}$, the lower the electromagnetic emission.

Standard Termination
Recommended bus split termination is shown in the Figure 23. Considering passive network, without active stars, proper termination should be applied at the two nodes that have the maximum electrical distance on the bus. The sum of termination resistors values should match the nominal cable impedance. At other nodes a high-ohmic split termination should be applied.

Custom Termination

In some cases a specific termination topology is required for middle modes. Such a termination connection and typical values are shown in Figure 25 and Table 9.

Common Mode Choke

A common mode choke is used to improve the emission and immunity performance. The function of the common mode choke is to force the current in both signal wires to be of the same strength, but opposite direction. Therefore, the choke represents high impedance for common mode signals. The parasitic stray inductance should be as low as possible in order to keep oscillations on the bus low. The common mode choke is placed between transceiver and split termination [2].

onsemi products including the boards are not designed, intended, or authorized for use in life support systems, or any FDA Class 3 medical devices or medical devices with a similar or equivalent classification in a foreign jurisdiction, or any devices intended for implantation in the human body. You agree to indemnify, defend and hold harmless onsemi, its directors, officers, employees, representatives, agents, subsidiaries, affiliates, distributors, and assigns, against any and all liabilities, losses, costs, damages, judgments, and expenses, arising out of any claim, demand, investigation, lawsuit, regulatory action or cause of action arising out of or associated with any unauthorized use, even if such claim alleges that onsemi was negligent regarding the design or manufacture of any products and/or the board.

This evaluation board/kit does not fall within the scope of the European Union directives regarding electromagnetic compatibility, restricted substances (RoHS), recycling (WEEE), FCC, CE or UL, and may not meet the technical requirements of these or other related directives.

FCC WARNING – This evaluation board/kit is intended for use for engineering development, demonstration, or evaluation purposes only and is not considered by onsemi to be a finished end product fit for general consumer use. It may generate, use, or radiate radio frequency energy and has not been tested for compliance with the limits of computing devices pursuant to part 15 of FCC rules, which are designed to provide reasonable protection against radio frequency interference. Operation of this equipment may cause interference with radio communications, in which case the user shall be responsible, at its expense, to take whatever measures may be required to correct this interference.

onsemi does not convey any license under its patent rights nor the rights of others.

LIMITATIONS OF LIABILITY: onsemi shall not be liable for any special, consequential, incidental, indirect or punitive damages, including, but not limited to the costs of requalification, delay, loss of profits or goodwill, arising out of or in connection with the board, even if onsemi is advised of the possibility of such damages. In no event shall onsemi’s aggregate liability from any obligation arising out of or in connection with the board, under any theory of liability, exceed the purchase price paid for the board, if any.

The board is provided to you subject to the license and other terms per onsemi’s standard terms and conditions of sale. For more information and documentation, please visit www.onsemi.com.
