ORDERING INFORMATION

See detailed ordering and shipping information on page 2 of this data sheet.

Description

The FAN5341 is an asynchronous constant−current LED driver capable of efficiently delivering up to 500 mW to a string of up to five LEDs in series. Optimized for small form−factor applications, the 1.2 MHz fixed switching frequency allows the use of small chip inductors and capacitors.

The FAN5341 uses a simple single−wire digital control interface to program the brightness levels of the LEDs in 32 linear steps by applying digital pulses.

For safety, the device features integrated over−voltage, over−current, short−circuit detection, and thermal−shutdown protection. In addition, input under−voltage lockout protection is triggered if the battery voltage is too low.

The FAN5341 is available in a very low profile, small form−factor 2 mm x 2 mm x 0.55 mm 6−lead UMLP package that is green and RoHS compliant.

Features

- Asynchronous Boost Converter
- Internal Schottky Diode
- Up to 500 mW Output Power
- Drives 3 to 5 LEDs in Series
- 2.7 V to 5.5 V Input Voltage Range
- Single−Wire Digital Control Interface to Set LED Brightness Levels
  - 32 Linear Steps
- 1.2 MHz Fixed Switching Frequency
- Soft−Start Capability
- Input Under−Voltage Lockout (UVLO)
- Output Over−Voltage Protection (OVP)
- Short−Circuit Detection
- Thermal Shutdown (TSD) Protection
- Low Profile 6−lead 2.0 x 2.0 x 0.55 mm UMLP Package
- This Device is Pb−Free, Halogen Free/BFR Free and is RoHS Compliant

Applications

- Cellular Mobile Handsets
- Mobile Internet Devices
- Portable Media Players
- PDA, DSC, MP3 Players

PIN CONFIGURATION

Figure 3. UMLP6 Package (Top View)

Table 2. PIN DEFINITIONS

Pin #	Name	Description
1	VOUT	Boost Output Voltage. Output of the boost regulator. Connect the LEDs to this pin. Connect C_{OUT} (Output Capacitor) to GND.
2	VIN	Input Voltage. Connect to power source and decouple with C_{IN} to GND.
3	EN	Enable Brightness Control. Program dimming levels by driving pin with digital pulses.
4	FB	Voltage Feedback. The boost regulator regulates this pin to 0.253 V to control the LED string current. Tie this pin to a current setting resistor (R_{SET}) between GND and the cathode of the LED string.
5	SW	Switching node. Tie inductor L1 from VIN to SW pin.
6	GND	Ground. Tie directly to a GND plane.

Table 3. ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter		Min.	Max.	Units
V_{IN}	VIN Pin		−0.3	6.0	V
V_{FB}, V_{EN}	FB, EN Pins		−0.3	V_{IN} + 0.3	V
V_{SW}	SW Pin		−0.3	22.0	V
V_{OUT}	VOUT Pin		−0.3	22.0	V
ESD	Electrostatic Discharge Protection Level	Human Body Model per JESD22−A114	3.3		kV
		Charged Device Model per JESD22−C101	2.0		
T_J	Junction Temperature		−40	+150	°C
T_{STG}	Storage Temperature		−65	+150	°C
T_L	Lead Soldering Temperature, 10 Seconds			+260	°C

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

Table 4. RECOMMENDED OPERATING CONDITIONS

Symbol	Parameter		Min.	Max.	Units
V_{IN}	V_{IN} Supply Voltage		2.7	5.5	V
V_{OUT}	VOUT Voltage (Note 1)		6.2	17.5	V
I_{OUT}	VOUT Load Current	500 mW Maximum Output Power	5	25	mA
T_A	Ambient Temperature		−40	+85	°C
T_J	Junction Temperature		−40	+125	°C

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.
1. Application should guarantee that minimum and maximum duty−cycle should fall between 20−85% to meet the specified range.

Table 5. THERMAL PROPERTIES

Symbol	Parameter	Typical	Units
θ_{JA}	Junction−to−Ambient Thermal Resistance, UMLP6 Package	70	°C/W

NOTE: Junction−to−ambient thermal resistance is a function of application and board layout. This data is measured with four−layer 2s2p boards in accordance to JEDEC standard JESD51. Special attention must be paid not to exceed junction temperature $T_{J(max)}$ at a given ambient temperature T_A.

Table 6. ELECTRICAL SPECIFICATIONS

(V_{IN} = 2.7 V to 5.5 V and T_A = −40C to +85°C unless otherwise noted. Typical values are at T_A = 25°C and V_{IN} = 3.6 V.)

Symbol	Parameter	Conditions	Min	Typ	Max	Units
POWER SUPPLIES						
I_{SD}	Shutdown Supply Current	EN = GND, V_{IN} = 3.6 V		0.30	0.75	μA
V_{UVLO}	Under−Voltage Lockout Threshold	V_{IN} Rising	2.10	2.35	2.60	V

CIRCUIT DESCRIPTION
Overview
The FAN5341 is an inductive current−mode boost serial LED driver that achieves LED current regulation by maintaining 0.253 V across the R_{SET} resistor. The current through the LED string (I_{LED}) is therefore given by:

$$I_{LED} = \frac{0.253}{R_{SET}} \qquad \text{(eq. 1)}$$

The voltage V_{OUT} is determined by the sum of the forward voltages across each LED, plus the voltage across R_{SET}, which is always 253 mV.

Driving Five LEDs in Series
FAN5341 can drive five LEDs in series but, the forward voltage (V_F) of the LED MUST be less than 3.5 V such that it remains under the over−voltage specification of 18.9 V.

UVLO and Soft−Start
If EN has been low for more than 1 ms, the IC may initiate a "cold start" soft−start cycle when EN rises, provided V_{IN} is above the UVLO threshold.

Digital Interface
The FAN5341 implements a single−wire digital interface to program the LED brightness to one of thirty−two (32) levels spaced in linear steps. With this single−wire solution, the FAN5341 does not require the system processor to constantly supply a signal to it to drive the LEDs.

Digital Dimming Control
The FAN5341 starts driving the LEDs at the maximum brightness level. After startup, the control logic is ready to accept programming pulses to decrease the brightness level by the number of positive edges applied to the EN pin. Figure 14 shows the digital pulse dimming control.

Over−Current and Short−Circuit Detection
The boost regulator employs a cycle−by−cycle peak inductor current limit of ~750 mA.

Over−Voltage / Open−Circuit Protection
If the LED string is an open circuit, FB remains at 0 V and the output voltage continues to increase in the absence of an over−voltage protection (OVP) circuit. The FAN5341's OVP circuit disables the boost regulator when V_{OUT} exceeds 18.9 V and continues to keep the regulator off until V_{OUT} drops below 18.1 V.

Thermal Shutdown
When the die temperature exceeds 150°C, a reset occurs and remains in effect until the die cools to 125°C, at which time, the circuit is allowed to begin the soft−start sequence.

		LPF2010T−4R7M	ABCO			

Component Placement and PCB Recommendations
Figure 15. Recommended Component Placement

Input Capacitance

In a typical application, the input and output capacitors should be placed as close to the IC as possible; no additional capacitance is needed to ensure proper functionality. However, in a testing environment, where the FAN5341 is typically powered by a power supply with relatively long cables, an additional input capacitor (10 μF) may be needed to ensure stable functioning. This capacitor should be placed close to where the power supply cables attach to the FAN5341 evaluation board.

PCB Recommendations

- The inductor can be connected to VIN with vias through another layer if needed.
- The feedback pin should be connected back to the IC on a sub−layer.
