Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

1. R_{θJA} is determined with the device mounted on a 1 in² pad 2 oz copper pad on a 1.5 x 1.5 in. board of FR–4 material. R_{θJC} is guaranteed by design while R_{θCA} is determined by the user's board design.

a. 57°C/W when mounted on a 1 in² pad of 2 oz copper

b. 161°C/W when mounted on a minimum pad of 2 oz copper

2. Pulse Test: Pulse Width < 300 μs, Duty cycle < 2.0%.
3. The diode connected between the gate and source serves only as protection against ESD. No gate overvoltage rating is implied.
4. As an N–ch device, the negative V_{gs} rating is for low duty cycle pulse occurrence only. No continuous rating is implied.
5. R_g is measured on 100% of the die at wafer level.
