

# **SscFWS Flash-micro Writing System**

## **Simple Users Manual**

**V4.01 2017/12/28**

**ON Semiconductor  
Microcontroller BU.**

## **SscFWS Flash-micro Writing System**

### **Overview**

The SscFWS Flash-micro Writing System (SscFWS) is used to program, verify, and erase programming data into and from flash-ROM chips for the one-chip microcontrollers incorporating flash ROM supplied by ON Semiconductor. SscFWS has the following features:

- (1) Capable of connecting to a maximum of 16 writer units via USB and program all of them at the same time.
- (2) Supports proprietary functions of ON Semiconductor microcontrollers such as read protection.
- (3) Allows the user to program data repeatedly with no manual intervention from the PC. This feature is provided on the assumption that SscFWS be used on the production line. (It is still necessary to connect writer units to PC.)

## **1. System Configuration**

### **(1)Writer Unit**

Writer Unit is used to program into FLASH-ROM micro.

There are three types of writer units, and all types need to be connected to PC via USB.

#### i)SKK (SKK/SKK Type B/SKK Type C)

SKK is used with an adaptor for each particular series. Place the adaptor on SKK's DIP32 socket and place a FLASH-ROM micro to use. \*Type C has different functions. See "About\_SKK-TypeC\_100706.pdf"

#### ii) SKK-DBG (SKK-DBG/SKK-DBG Type B/SKK-DBG Type C)

SKK-DBG is used with a micro which has On-Chip Debugger built in, and it programs via the debugger terminals. It enables programming to a micro on user board. SKK-DBG does not supply power to the target micro. Supply the power to the micro from the set board.

\*Type C has different functions. See "About\_SKK-TypeC\_100706.pdf".

### **(2)SscFWS Software**

SscFWS software controls writer unit from PC.

\*It is necessary to install the software from the provided install-CD before connecting writer units.

\*The software is updated when a newly supported micro is added. Latest version of the software can be downloaded from the download site.

<http://www.onsemi.com/PowerSolutions/taxonomy.do?id=101533&currentSession=D8CB617E0E39EAC9728C39812191B11D>

### **(3)Hardware Requirements**

A PC to be used with the SscFWS must satisfy the following conditions:

#### -PC type

Must have at least one USB port (version 1.1 or version 2.0 (full-speed compatible)).

#### -OS

Windows XP

Windows VISTA

Windows 7

Windows 8

#### -Hardware requirements

The OS-recommended CPU and memory requirements must be satisfied.

The hard disk must have a free disk space of 10MB or more.

## **2. Starting and Exiting SscFWS**

### **(1)Setting up Writer Unit**

Before connecting a writer unit to a PC, you need to configure its unit ID. This unit ID is used by the application on the PC to identify the individual writer units. You need to assign unique IDs to the writer units to be connected to the PC. The ID can be configured by setting the rotary DIP switch in the writer unit. You can assign IDs of 0 to F. The PC can accommodate a maximum of 16 writer units.

Note: When connecting more than two writer units, they all must be the same type.

### **(2)Cabling Writer Unit**

The writer units and PC need to be connected via USB cable.

To install device driver for writer unit, select [Start]->[All Programs]->[SscFWS Flash-micro Writing System]->[Install Device Driver].

The SscFWS application program recognizes only the writer units that have been connected at the start time.

Note: Do not put in or out any writer unit while the SscFWS application program is running.

Note: Do not put in or out any SKKs as the device is placed on the socket.

Note: Do not put in or out any SKK-DBGs as the device's debugger terminals are connected to the unit.

### **(3)Starting SscFWS**

Before starting SscFWS, you need to connect and configure the writer unit.

To start SscFWS, double-click the shortcut icon named "SscFWS" which is created by the installer. You can also start SscFWS and have it read in the target HEX file by dragging & dropping the HEX file onto this shortcut icon.

*Note: When "Code: 20006" error occurs, update the firmware version of the writer unit following the instruction in "5. Firmware Update".*

### **(4)Exiting SscFWS**

To exit SscFWS, choose "Exit Application" from the [File] menu. You cannot terminate any SscFWS application program that is in the process of programming.

### **3. Operating Procedures**

#### **(1)Selecting Units**

Select target writer units by choosing [Select Unit] from the [Configure] menu or from checkboxes in the main window.

#### **(2)Selecting Series**

There are two ways to select a series.

- i) Choose [Select Series] from the [Configure] menu, and manually select a series from the pull-down menu.
- ii) Read an Intel Hexadecimal format file (HEX file) generated by Microcontroller Development Tool and it automatically selects a series (It does not automatically select the series when reading a HEX file that is not registered.).

#### **(3)Loading a HEX File**

There are two ways to load a HEX file.

- i) Choose [Open HEX File] from the [File] menu to load the HEX file on the PC. When loaded, SscFWS automatically identifies the series from the data in the HEX file. Nonetheless, you must make sure that the correct series is selected. If SscFWS fails to identify the series from the HEX file, manually select a series performing the step (2) Selecting Series.
- ii) SscFWS reads FLASH-ROM data in a micro placed in the writer unit with the smallest ID. Choose [Read] from [Operation] to read the FLASH-ROM data. This feature is available only with SKK.

#### **(4)Connecting Target Device**

- i) When using SKK, place an adaptor for each particular series on DIP32 sockets, and place a FLASH-ROM micro on it.
- ii) When using SKK-DBG, read Section 4 “About Wiring Target Device to SKK-DBG” first and prepare to connect a target device. First connect SKK-DBG to target device with five wires or three wires, then supply a power to the device. When disconnecting, turn off the target device first and disconnect it from SKK-DBG.  
\* Supply the power to the micro from the set board.

#### **(5)Program**

SscFWS performs a sequence of [Erase]-->[Program]-->[Verify] operations. When verifying the data, it also performs margin test.

#### **(6)Remote Operation**

By pressing the “START” button on the unit, it can perform variety of operations. To select an operation to be assigned to the button, choose [External Switch] form [Configure] and click on the one of the operations in a pull-down menu. When connecting to a multiple writer units, use a button on the least assigned ID unit recognized by SscFWS.

**The details of the usage should start application and refer to the help for them.**

#### **4. About Wiring Target Device to SKK-DBG**

SKK-DBG and target micro are connected using five wires or three wires described below. Terminals to be wired on the target micro vary depending on its series. If there are more than two connection terminals, only one terminal needs to be connected to write.

Power needs to be supplied to the target micro from user set.

Note: Power supply voltage of the target micro needs to be set to a value specified in “F-ROM Programming Characteristics” in its specification sheets.

Note: Programming by SKK-DBG does not guarantee its operation when supply voltage to the target micro is less than 3.0V.

Note: If the micro has a LVD, POR function, write with the power supply voltage that is higher than the selected level of LVD, POR.

See the “Table of Wiring SKK-DBG and Target Micro” and “Recommended Circuitry of Terminals of Target Micro” to connect the target device and SKK-DBG. For Type B, see the “Table of SKK-DBG D-SUB Connector Pin assignment”, and for Type C, see the “SKK-DBG Type C included cables”.

On SKK-DBG, “GND”, “RES#”, “DBGP0”, “DBGP1” and “DBGP2” needs to be wired. Terminals to be wired on the target micro vary depending on its series. Refer to the “Table of SKK-DBG D-SUB Connector Pin Assignment” and “Table of Wiring SKK-DBG and Target Micro” for the wiring of the writer unit and the target micro. It is recommended to follow the “Recommended Circuitry of Terminals of Target Micro”.

**Table of SKK-DBG D-SUB Connector Pin Assignment**

D-SUB pin number	pin	
①	GND	
②	DBGP0	
③	DBGP2	
④	+5v	←Do not connect wire
⑤	NC	
⑥	RES#	
⑦	DBGP1	
⑧	+3.3v	←Do not connect wire
⑨	NC

### Recommended Circuitry of Terminals of Target Micro (five wire type, for Type B)

### Recommended Circuitry of Terminals of Target Micro (five wire type, for Type C)

Note: Reset Circuit for the target micro needs to be the one such that SKK-DBG can generate a LOW level on the RES# pin.

Note: Place 100 $\Omega$  of current-limit resistors as close to the micro as possible.

Note: Use low capacitance cables for connecting a user's set and a SKK-DBG. Its length must be less than 50cm.  
RS232C cables on the market is not supported.

Note: When two or more debugger ports are available on a micro, unused DBG\_P2 pin(s) must be pulled low or high with 100KΩ.

**Table of Wiring SKK-DBG and Target Micro (For three wire type, Type C only)**

LC87F2W48A	VSS1,VSS2,VSS3	OWP0	VDD1,VDD2,VDD3
LC87F9W48A	VSS1,VSS2,VSS3,AVSS	OWP0	VDD1,VDD2,VDD3,AVDD
LC87DL216A	VSS1	OWP0	VDD1
LC87FTR64Z	VSS1,VSS2,VSS3	OWP0	VDD1,VDD2,VDD3

\*Above table lists the pin names to be wired. For pin numbers, please refer to the pin assignment for each series.

(Note1) This pin is an input pin that power is supplied to SKK-DBG from the target micro. This pin goes the level-shifter to match the communication signal level with the target micro's power supply voltage.

**Recommended Circuitry of Terminals of Target Micro (three wire type, for Type C)**

## **5. Firmware Update**

### **(1) Reasons to Update Firmware**

SscFWS Flash-micro writing system is updated regularly to support newly released micros, and those updates include software updates and/or firmware updates. There might be a case that the system does not start under some combinations of software and firmware version.

SscFWS automatically checks the compatibility of the firmware. If the firmware update is required, it shows an error message “Code: 20006”. If this error code appears, please update the firmware.

### **(2) Procedure for Firmware Update**

Firmware can be updated by an included application.

Procedure for the update, please refer to the separated document  
“SscFWS\_Version\_Up\_Procedure\_Eng\_171228.pdf”
