3.3 V USB 3.1 Quad Channel / Dual Port Linear Redriver

Description

The NB7NPQ7041M is a 3.3 V quad channel / dual port linear redriver suitable for USB 3.1 Gen 1 and USB 3.1 Gen 2 applications that supports both 5 Gbps and 10 Gbps data rates. Signal integrity degrades from PCB traces, transmission cables, and inter-symbol interference (ISI). The NB7NPQ7041M compensates for these losses by engaging varying levels of equalization at the input receiver, and flat gain amplification on the output transmitter. The Flat Gain and Equalization are controlled by four level control pins. Each channel has a set of independent control pins to make signal optimization possible.

After power up, the NB7NPQ7041M periodically checks both of the TX output pairs of each port for a receiver connection. When the receiver is detected on both channels, the RX termination becomes enabled of that respective port and is set to perform the redriver function.

The port becomes active once both TX outputs have detected 50-ohm termination, and the NB7NPQ7041M is set to perform the redriver function. Port AB (channels A & B) and port CD (channels C & D) are independent of each other.

The NB7NPQ7041M comes in a small 3.1 x 4.3 mm X2QFN34 package and is specified to operate across the entire industrial temperature range, -40°C to 85°C.

Features

- 3.3 V ± 5% Power Supply
- Supports USB 3.1 Gen 1 and USB 3.1 Gen 2 Data Rates
- Automatic Receiver Termination Detection
- Integrated Input and Output Termination
- Independent, Selectable Equalization and Flat Gain
- Hot-Plug Capable
- Flow-through Design for Ease of PCB Layout
- ESD Protection: 4 kV HBM
- Operating Temperature Range: -40°C to 85°C
- Small 3.1 x 4.3 x 0.35 mm X2QFN34 Package
- This is a Pb-Free Device

Typical Applications

- USB3.1 Type-C and Type-A Signal Routing
- Mobile Phone and Tablet
- Computer and Laptop
- Docking Station and Dongle
- Active Cable, Back Planes
- Gaming Console, Smart T.V., Set-Top Boxes

APPLICATION GUIDELINES

LFPS Compliance Testing

As part of USB 3.1 compliance test, the host or peripheral must transmit a LFPS signal that adheres to the spec parameters. The NB7NPQ7041M is tested as a part of a USB compliant system to ensure that it maintains compliance while increasing system performance.

LFPS Functionality

USB 3.1, Gen1 and Gen2 use Low Frequency Periodic Signaling.

(LFPS) to implement functions like exiting low-power modes, performing warm resets and providing link training between host and peripheral devices. LFPS signaling consists of bursts of frequencies ranging between 10 to 50 MHz and can have specific burst lengths or repeat rates.

Ping.LFPS for TX Compliance

During the transmitter compliance, the system under test must transmit certain compliance patterns as defined by the USB-IF. In order to toggle through these patterns for various tests, the receiver must receive a ping.LFPS signal from either the test suite or a separate pattern generator. The standard signal comprises of a single burst period of 100 ns at 20 MHz.

Control Pin Settings

Control pins A1, A0, B1, and B0 control the Flat Gain and the Equalization of channels A and B and control pins C1, C0, D1, and D0 control the Flat Gain and the Equalization of channels C and D of the NB7NPQ7041M Device.

The Float (Default) Setting “F” can be set by leaving the control pins in a floating state. The Redriver will internally

bias the control pins to the correct voltage to achieve this if the pin is not connected to a voltage source. The low Setting “L” is set by pulling the control pin to ground. Likewise the high setting “H” is set by pulling the pin high to VCC. The Rexternal setting can be set by adding a 68-K resistor from the control pin to ground. This will bias the Redriver internal voltage to 33% of VCC.

Linear Equalization

The linear equalization that the NB7NPQ7041M provides compensates for losses that occur naturally along board traces and cable lines. Linear Equalization boosts high frequencies and lower frequencies linearly so when transmitting at varying frequencies, the voltage amplitude will remain consistent. This compensation electrically counters losses and allows for longer traces to be possible when routing.

DC Flat Gain

DC flat gain equally boosts high and low frequency signals, and is essential for countering low frequency losses.

DC flat gain can also be used to simulate a higher input signal from a USB Controller. If a USB controller can only provide 800 mV differential to a receiver, it can be boosted to 1128 mV using 3 dB of flat gain.

Total Gain

When using Flat Gain with Equalization in a USB application it is important to make sure that the total voltage does not exceed 1200 mV. Total gain can be calculated by adding the EQ gain to the FG.

Figure 5. Typical Application

Table 11. DESIGN REQUIREMENTS

Design Parameter	Value
Supply Voltage	3.3 V nominal, (3.135 V to 3.465 V)
Operation Mode (Control Pin Selection)	Floating by Default, adjust for application losses See Table 2
AC Coupling Capacitors (TX)	100 nF nominal, 75 nF to 265 nF, see Figure 5
R _{external}	68 kΩ, ±10%
RX Pull Down Resistors at Receptacle	200 KΩ to 220 KΩ
Power Supply Capacitors	100 nF to GND close to each Vcc pin, and 10 μF to GND on the Vcc plane
Trace loss of FR4 before NB7NPQ7021M	Up to 11 inches
Trace loss of FR4 after NB7NPQ7021M	Up To 3 inches. Keep as short as possible for best performance.
Linear Range at 5 GHz	900 mV differential
DC Flat Gain Options	-1 dB, 0 dB, 2 dB
Equalization Options	3 to 11 dB
Differential Trace Impedance	90 Ω ±10%

9. Trace loss of FR4 was estimated to have 1 dB of loss per 1 inch of FR4 length with matched impedance and no VIAS.

Typical Layout Practices

- RX and TX pairs should maintain as close to a 90 Ω differential impedance as possible.
- Limit the number of vias used on each data line. It is suggested that 2 or fewer are used.
- Traces should be routed as straight and symmetric as possible.
- RX and TX differential pairs should always be placed and routed on the same layer directly above a ground plane. This will help reduce EMI and noise on the data lines.
- Routing angles should be obtuse angles and kept to 135 degrees or larger.
- To minimize crosstalk, TX and RX data lines should be kept away from other high speed signals.
