

# NCN4555

## 1.8V / 3V SIM Card Power Supply and Level Shifter

The NCN4555 is a level shifter analog circuit designed to translate the voltages between a SIM Card and an external microcontroller or MPU. A built-in LDO-type DC-DC converter makes the NCN4555 useable to drive 1.8 V and 3.0 V SIM card. The device fulfills the ISO7816-3 smart card interface standard as well as GSM 11.11 and related (11.12 and 11.18) and 3G mobile requirements (IMT-2000/3G UICC standard). With the  $\overline{STOP}$  pin a low current shutdown mode can be activated making the battery life longer. The Card power supply voltage (SIM\_VCC) is selected using a single pin (MOD\_VCC).

### Features

- Supports 1.8 V or 3.0 V Operating SIM Card
- The LDO is able to Supply More than 50 mA under 1.8 V and 3.0 V
- Built-in Pullup Resistor for I/O Pin in Both Directions
- All Pins are Fully ESD Protected According to ISO-7816 Specifications – ESD Protection on SIM Pins in Excess of 7 kV (Human Body Model)
- Supports up to More than 5 MHz Clock
- Low-Profile 3x3 QFN-16 Package
- These are Pb-Free Devices\*

### Typical Applications

- SIM Card Interface Circuit for 2G, 2.5G and 3G Mobile Phones
- Identification Module
- Smart Card Readers
- Wireless PC Cards

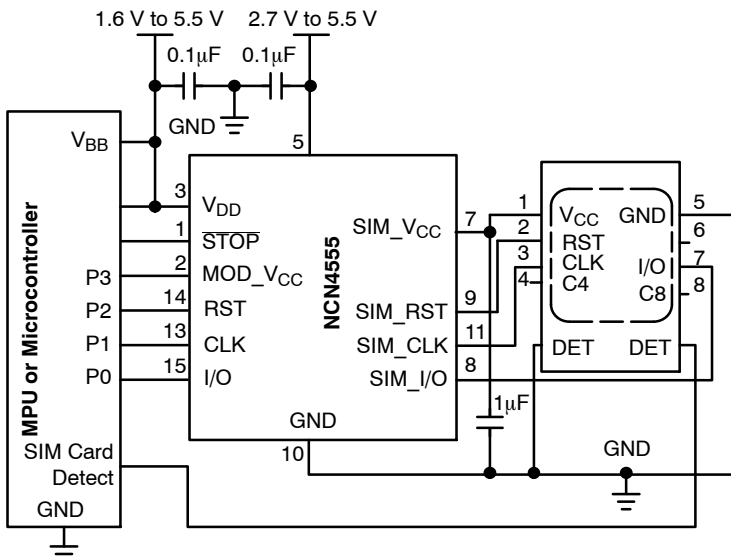

Figure 1. Typical Interface Application

## PIN DESCRIPTIONS

PIN	Name	Type	Description
1	$\overline{\text{STOP}}$	INPUT	Power Down Mode pin: $\overline{\text{STOP}} = \text{Low} \rightarrow$ Low current shutdown mode activated $\overline{\text{STOP}} = \text{High} \rightarrow$ Normal Operation A Low level on this pin resets the SIM interface, switching off the SIM_VCC.
2	MOD_VCC	INPUT	The signal present on this pin programs the SIM_VCC value: MOD_VCC = Low $\rightarrow$ SIM_VCC = 1.8 V MOD_VCC = High $\rightarrow$ SIM_VCC = 3 V
3	VDD	POWER	This pin is connected to the system controller power supply. It configures the level shifter input stage to accept the signals coming from the microprocessor. A 0.1 $\mu\text{F}$ capacitor shall be used to bypass the power supply voltage. When VDD is below 1.1 V typical the SIM_VCC is disabled. The NCN4555 comes into a shutdown mode.
4	NC		No Connect
5	VBAT	POWER	DC-DC converter supply input. The input voltage ranges from 2.7V up to 5.5V. This pin has to be bypass by a 0.1 $\mu\text{F}$ capacitor.
6	NC		No Connect
7	SIM_VCC	POWER	This pin is connected to the SIM card power supply pin. An internal LDO converter is programmable by the external MPU to supply either 1.8 V or 3.0 V output voltage. An external 1.0 $\mu\text{F}$ minimum ceramic capacitor recommended must be connected across SIM_VCC and GND. During a normal operation, the SIM_VCC voltage can be set to 1.8 V followed by a 3.0 V value, or can start directly to any of these two values.
8	SIM_I/O	INPUT/ OUTPUT	This pin handles the connection to the serial I/O of the card connector. A bidirectional level translator adapts the serial I/O signal between the card and the micro controller. A 14 k $\Omega$ (typical) pullup resistor provides a High impedance state for the SIM card I/O link.
9	SIM_RST	OUTPUT	This pin is connected to the RESET pin of the card connector. A level translator adapts the external Reset (RST) signal to the SIM card.
10	GND	GROUND	This pin is the GROUND reference for the integrated circuit and associated signals. Care must be taken to avoid voltage spikes when the device operates in a normal operation.
11	SIM_CLK	OUTPUT	This pin is connected to the CLOCK pin of the card connector. The CLOCK (CLK) signal comes from the external clock generator, the internal level shifter being used to adapt the voltage defined for the SIM_VCC.
12	NC		No Connect
13	CLK	INPUT	The clock signal, coming from the external controller, must have a Duty Cycle within the Min/Max values defined by the specification (typically 50%). The built-in level shifter translates the input signal to the external SIM card CLK input.
14	RST	INPUT	The RESET signal present at this pin is connected to the SIM card through the internal level shifter which translates the level according to the SIM_VCC programmed value.
15	I/O	INPUT/ OUTPUT	This pin is connected to an external microcontroller or cellular phone management unit. A bidirectional level translator adapts the serial I/O signal between the smart card and the external controller. A built-in constant 18 k $\Omega$ (typical) resistor provides a high impedance state when not activated.
16	NC		No Connect

APPLICATION INFORMATION

CARD SUPPLY CONVERTER

The NCN4555 interface DC-DC converter is a Low Dropout Voltage Regulator capable of supplying a current in excess of 50 mA under 1.8 V or 3.0 V. This device features a very low quiescent current typically lower than 25  $\mu$ A (Figure 6 and 7). MOD\_VCC is a select input allowing a logic level signal to select a regulated voltage of 1.8 V (MOD\_VCC = LOW) or 3.0 V (MOD\_VCC = HIGH). Additionally, the NCN4555 has a shutdown input allowing it to turn off or turn on the regulator output. The shutdown mode power consumption is typically in the range of a few tens of nA (30 nA Typical). Figure 8 shows a simplified view of the NCN4555 voltage regulator. The SIM\_VCC output is internally current limited and protected against short circuits. The short-circuit current  $I_{VCC}$  is constant over the temperature and SIM\_VCC. It varies with VBAT typically in the range of 60 mA to 90 mA (Figure 4 and 5).

In order to guarantee a stable and satisfying operating of the LDO the SIM\_VCC output will be connected to a 1.0  $\mu$ F bypass ceramic capacitor to the ground. At the input, VBAT will be bypassed to the ground with a 0.1  $\mu$ F ceramic capacitor.

LEVEL SHIFTERS

The level shifters accommodate the voltage difference that might exist between the microcontroller and the smart card. The RESET and CLOCK level shifters are monodirectional and feature both the same architecture.

The bidirectional I/O line provides a way to automatically adapt the voltage difference between the MCU and the SIM card in both directions. In addition with the pullup resistor, an active pullup circuit (Figure 8, Q1 and Q2) provides a fast charge of the stray capacitance, yielding a rise time fully within the ISO7816 specifications.

Figure 8. Simplified Block Diagram of the LDO Voltage Regulator

Figure 9. Basic I/O Line Interface

The typical waveform provided in Figure 10 shows how the accelerator operates. During the first 200 ns (typical), the slope of the rise time is solely a function of the pullup resistor associated with the stray capacitance. During this period, the PMOS devices are not activated since the input voltage is below their  $V_{gs}$  threshold. When the input slope crosses the  $V_{gsth}$ , the opposite one shot is activated, providing a low impedance to charge the capacitance, thus increasing the rise time as depicted in Figure 10. The same mechanism applies for the opposite side of the line to make sure the system is optimum.

**INPUT SCHMITT TRIGGERS**

All the Logic input pins (excepted I/O and SIM\_I/O, See Figure 3) have built-in Schmitt trigger circuits to prevent the NCN4555 against uncontrolled operation. The typical dynamic characteristics of the related pins are depicted Figure 11.

The output signal is guaranteed to go High when the input voltage is above  $0.7 \times V_{DD}$ , and will go Low when the input voltage is below  $0.4 \text{ V}$ .

**SHUTDOWN OPERATING**

In order to save power or for other purpose required by the application it is possible to put the NCN4555 in a shutdown mode by setting Low the pin  $\overline{STOP}$ . On the other hand the device enters automatically in a shutdown mode when  $V_{DD}$  becomes lower than  $1.1 \text{ V}$  typically.

**Figure 10. SIM\_IO Typical Rise and Fall Times with Stray Capacitance > 30 pF (33 pF Capacitor Connected on the Board)**

**ESD PROTECTION**

The NCN4555 SIM interface features an HBM ESD voltage protection in excess of  $7 \text{ kV}$  for all the SIM pins (SIM\_IO, SIM\_CLK, SIM\_RST, SIM\_VCC and GND). All the other pins (microcontroller side) sustain at least  $2 \text{ kV}$ . These values are guaranteed for the device in its full integrity without considering the external capacitors added to the circuit for a proper operating. Consequently in the operating conditions it is able to sustain much more than  $7 \text{ kV}$  on its SIM pins making it perfectly protected against electrostatic discharge well over the HBM ESD voltages required by the ISO7816 standard ( $4 \text{ kV}$ ).

**PRINTED CIRCUIT BOARD LAYOUT**

Careful layout routing will be applied to achieve a good and efficient operating of the device in its mobile or portable environment and fully exploit its performance.

The bypass capacitors have to be connected as close as possible to the device pins (SIM\_VCC,  $V_{DD}$  or  $V_{BAT}$ ) in order to reduce as much as possible parasitic behaviors (ripple and noise). It is recommended to use ceramic capacitors.

The exposed pad of the QFN-16 package will be connected to the ground as well as the unconnected pins (NC). A relatively large ground plane is recommended.

Figures 12 and 13 shows an example of PCB device implementation in an evaluation environment.

Buyer is responsible for its products and applications using **onsemi** products, including compliance with all laws, regulations and safety requirements or standards, regardless of any support or applications information provided by **onsemi**. "Typical" parameters which may be provided in **onsemi** data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. **onsemi** does not convey any license under any of its intellectual property rights nor the rights of others. **onsemi** products are not designed, intended, or authorized for use as a critical component in life support systems or any FDA Class 3 medical devices or medical devices with a same or similar classification in a foreign jurisdiction or any devices intended for implantation in the human body. Should Buyer purchase or use **onsemi** products for any such unintended or unauthorized application, Buyer shall indemnify and hold **onsemi** and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that **onsemi** was negligent regarding the design or manufacture of the part. **onsemi** is an Equal Opportunity/Affirmative Action Employer. This literature is subject to all applicable copyright laws and is not for resale in any manner.
