

Voltage Regulator - Low Iq, Low Dropout, Power Good Output 1.2 A

NCP187

The NCP187 is 1.2 A LDO Linear Voltage Regulator. It is a very stable and accurate device with low quiescent current consumption (typ. 30 μ A over the full temperature range), low dropout, low output noise and very good PSRR. The regulator incorporates several protection features such as Thermal Shutdown, Soft Start, Current Limiting and also Power Good Output signal for easy MCU interfacing.

Features

- Operating Input Voltage Range: 1.5 V to 5.5 V
- Adjustable and Fixed Voltage Options Available: 0.8 V to 5.2 V
- Low Quiescent Current: typ. 30 μ A over Temperature
- $\pm 2\%$ Accuracy Over Full Load, Line and Temperature variations
- PSRR: 75 dB at 1 kHz
- Low Noise: typ. 15 μ V_{RMS} from 10 Hz to 100 kHz
- Stable With Small 10 μ F Ceramic Capacitor
- Soft-start to Reduce Inrush Current and Overshoots
- Thermal Shutdown and Current Limit Protection
- Power Good Signal Extends Application Range
- Available in WDFN6 and WDFNW6 2x2, 0.5P Packages
- This is Pb-free Device

Typical Applications

- Wireless Chargers
- Portable Equipment
- Smart Camera and Robotic Vision Systems
- Telecommunication and Networking Systems

PIN FUNCTION DESCRIPTION

Pin No.	Pin Name	Description
1	IN	Input pin. A small capacitor is needed from this pin to ground to assure stability
6	OUT	Regulated output voltage pin. A small 10 μ F ceramic capacitor is needed from this pin to ground to assure stability
3, EXP	GND	Power supply ground
2	EN	Enable pin. Driving this pin high turns on the regulator. Driving EN pin low puts the regulator into shut-down mode
5	SNS	Sense pin. Connect this pin to regulated output voltage or resistor divider (adjustable version)
4	PG	Power Good, open collector. Use 10 k Ω to 100 k Ω pull-up resistor connected to output, input or other voltage (see maximum ratings)

APPLICATIONS INFORMATION

The NCP187 is the member of new family of high output current and low dropout regulators which delivers low quiescent and ground current consumption, good noise and power supply ripple rejection ratio performance. The NCP187 incorporates EN pin and power good output for simple controlling by MCU or logic. Standard features include current limiting, soft-start feature and thermal protection.

Input Decoupling (C_{IN})

It is recommended to connect at least $1\text{ }\mu\text{F}$ ceramic X5R or X7R capacitor between IN and GND pin of the device. This capacitor will provide a low impedance path for any unwanted AC signals or noise superimposed onto constant input voltage. The good input capacitor will limit the influence of input trace inductances and source resistance during sudden load current changes. Higher capacitance and lower ESR capacitors will improve the overall line transient response.

Output Decoupling (C_{OUT})

The NCP187 does not require a minimum Equivalent Series Resistance (ESR) for the output capacitor. The device is designed to be stable with standard ceramics capacitors with values of $4.7\text{ }\mu\text{F}$ or greater. Recommended capacitor for the best performance is $10\text{ }\mu\text{F}$. The X5R and X7R types have the lowest capacitance variations over temperature thus they are recommended.

Power Good Output Connection

The NCP187 include Power Good functionality for better interfacing to MCU system. Power Good output is open collector type, capable to sink up to 10 mA . Recommended operating current is between $10\text{ }\mu\text{A}$ and 1 mA to obtain low saturation voltage. External pull-up resistor can be

connected to any voltage up to 5.5 V (please see Absolute Maximum Ratings table above). Please note that Power Good internal circuitry is non-functional (disabled) to achieve the lowest possible internal current consumption in case of disabled LDO through Enable input ($EN = \text{Low}$). In this case internal Power Good transistor is open and output logic level is defined by voltage used for pull-up resistor. When Power Good is intended to be used as part of power sequencing functionality, then please connect external pull-up resistor to output voltage of NCP187. This will allow you to get correct low PG signal when LDO is disabled. Active discharge option is recommended to discharge output capacitors connected to LDO.

Power Good signal is internally delayed avoiding reaction to short glitches in output voltage. Blanking time is about $7\text{ }\mu\text{s}$ when voltage is decreasing from nominal value and about $15\text{ }\mu\text{s}$ when voltage is increasing back to nominal value.

Power Dissipation and Heat Sinking

The maximum power dissipation supported by the device is dependent upon board design and layout. Mounting pad configuration on the PCB, the board material, and the ambient temperature affect the rate of junction temperature rise for the part. For reliable operation junction temperature should be limited to $+125^{\circ}\text{C}$. The maximum power dissipation the NCP187 can handle is given by:

$$P_{D(\text{MAX})} = \frac{[T_{J(\text{MAX})} - T_A]}{R_{\theta JA}} \quad (\text{eq. 1})$$

The power dissipated by the NCP187 for given application conditions can be calculated from the following equations:

NCP187

$$P_D \approx V_{IN}(I_{GND} + I_{OUT}) + I_{OUT}(V_{IN} - V_{OUT}) \quad (\text{eq. 2})$$

or

$$V_{IN(MAX)} \approx \frac{P_{D(MAX)} + (V_{OUT} \times I_{OUT})}{I_{OUT} + I_{GND}} \quad (\text{eq. 3})$$

Hints

V_{IN} and GND printed circuit board traces should be as wide as possible. When the impedance of these traces is high, there is a chance to pick up noise or cause the regulator to malfunction. Place external components, especially the output capacitor, as close as possible to the NCP187, and make traces as short as possible.

NCP187

ADJUSTABLE VERSION

Not only adjustable version, but also any fixed version can be used to create adjustable voltage, where original fixed voltage becomes reference voltage for resistor divider and feedback loop. Output voltage can be equal or higher than original fixed option, while possible range is from 0.8 V up to 5.2 V. Picture below shows how to add external resistors to increase output voltage above fixed value.

Output voltage is then given by equation:

$$V_{OUT} = V_{FIX} \times (1 + R1/R2)$$

Figure 16.

Please note that output noise is amplified by V_{OUT} / V_{FIX} ratio. For example, if original 0.8 V fixed variant is used to create 3.6 V output voltage, output noise is increased $3.6/0.8 = 4.5$ times and real value will be $4.5 \times 15 \mu V_{rms} = 67.5 \mu V_{rms}$. For noise sensitive applications it is

recommended to use as high fixed variant as possible – for example in case above it is better to use 3.3 V fixed variant to create 3.6 V output voltage, as output noise will be amplified only $3.6/3.3 = 1.09 \times (16.4 \mu V_{rms})$.
