

NCV4264-2C

Linear Regulator, Low Dropout, Low I_Q

The NCV4264-2C is a low quiescent current consumption LDO regulator. Its output stage supplies 100 mA with $\pm 2.0\%$ output voltage accuracy.

Maximum dropout voltage is 500 mV at 100 mA load current.

It is internally protected against 45 V input transients, input supply reversal, output overcurrent faults, and excess die temperature. No external components are required to enable these features.

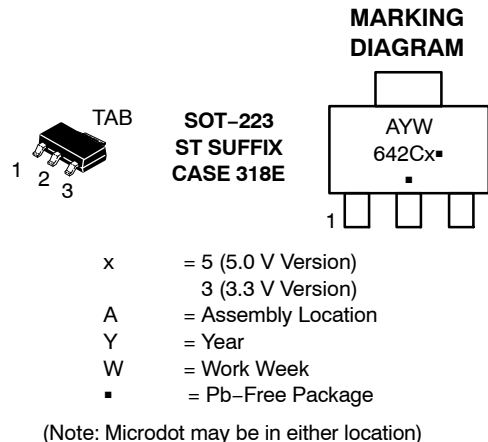

Features

- 3.3 V and 5.0 V Fixed Output
- $\pm 2.0\%$ Output Accuracy, Over Full Temperature Range
- 33 μA Typical Quiescent Current
- 500 mV Maximum Dropout Voltage at 100 mA Load Current
- Wide Input Voltage Operating Range of 4.5 V to 45 V
- Internal Fault Protection
 - ◆ -42 V Reverse Voltage
 - ◆ Short Circuit/Overcurrent
 - ◆ Thermal Overload
- NCV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC-Q100 Qualified and PPAP Capable
- This is a Pb-Free Device

PIN CONNECTIONS

ORDERING INFORMATION

See detailed ordering and shipping information in the package dimensions section on page 9 of this data sheet.

NCV4264-2C

Figure 1. Block Diagram

PIN FUNCTION DESCRIPTION

Pin No.	Symbol	Function
1	V_{IN}	Unregulated input voltage; 4.5 V to 45 V.
2	GND	Ground; substrate.
3	V_{OUT}	Regulated output voltage; collector of the internal PNP pass transistor.
TAB	GND	Ground; substrate and best thermal connection to the die.

OPERATING RANGE

Rating	Symbol	Min	Max	Unit
V_{IN} , DC Input Operating Voltage (Note 3)	V_{IN}	4.5	+45	V
Junction Temperature Operating Range	T_J	-40	+150	°C

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

MAXIMUM RATINGS

Rating	Symbol	Min	Max	Unit
V_{IN} , DC Input Voltage	V_{IN}	-42	+45	V
V_{OUT} , DC Voltage	V_{OUT}	-0.3	+32	V
Storage Temperature	T_{stg}	-55	+150	°C
Moisture Sensitivity Level	MSL	3		-
ESD Capability, Human Body Model (Note 1)	V_{ESDHB}	4000	-	V
ESD Capability, Machine Model (Note 1)	V_{ESDMIM}	200	-	V
Lead Temperature Soldering Reflow (SMD Styles Only), Lead Free (Note 2)	T_{sld}	-	265 pk	°C

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. This device series incorporates ESD protection and is tested by the following methods:

ESD HBM tested per AEC-Q100-002 (EIA/JESD22-A 114C)

ESD MM tested per AEC-Q100-003 (EIA/JESD22-A 115C)

2. Lead Free, 60 sec – 150 sec above 217°C, 40 sec max at peak.

3. See specific conditions for DC operating input voltage lower than 4.5 V in ELECTRICAL CHARACTERISTICS table at page 3

Circuit Description

The NCV4264–2C is a low quiescent current consumption LDO regulator. Its output stage supplies 100 mA with ±2.0% output voltage accuracy.

Maximum dropout voltage is 500 mV at 100 mA load current. It is internally protected against 45 V input transients, input supply reversal, output overcurrent faults, and excess die temperature. No external components are required to enable these features.

Regulator

The error amplifier compares the reference voltage to a sample of the output voltage (V_{OUT}) and drives the base of a PNP series pass transistor by a buffer. The reference is a bandgap design to give it a temperature–stable output. Saturation control of the PNP is a function of the load current and input voltage. Oversaturation of the output power device is prevented, and quiescent current in the ground pin is minimized.

Regulator Stability Considerations

The input capacitor C_{IN} in Figure 2 is necessary for compensating input line reactance. Possible oscillations caused by input inductance and input capacitance can be damped by using a resistor of approximately 1 Ω in series with C_{IN}. The output or compensation capacitor, C_{OUT} helps determine three main characteristics of a linear regulator: startup delay, load transient response and loop stability. Tantalum, aluminum electrolytic, film, or ceramic capacitors are all acceptable solutions, however, attention must be paid to ESR constraints. The capacitor manufacturer’s data sheet usually provides this information. The value for the output capacitor C_{OUT} shown in Figure 2 should work for most applications; however, it is not necessarily the optimized solution. Stability is guaranteed at values of C_{OUT} ≥ 10 μF, with an ESR ≤ 3.5 Ω for the 5.0 V Version with an ESR ≤ 3.35 Ω for the 3.3 V Version within the operating temperature range. Actual limits are shown in a graph in the Typical Performance Characteristics section.

Calculating Power Dissipation in a Single Output Linear Regulator

The maximum power dissipation for a single output regulator (Figure 3) is:

$$P_{D(max)} = [V_{IN(max)} - V_{OUT(min)}] * I_{OUT(max)} + V_{IN(max)} * I_q \tag{eq. 1}$$

Where:

V_{IN(max)} is the maximum input voltage,

V_{OUT(min)} is the minimum output voltage,

I_{OUT(max)} is the maximum output current for the application, and I_q is the quiescent current the regulator consumes at I_{OUT(max)}. Once the value of P_{D(max)} is known, the maximum permissible value of R_{θJA} can be calculated:

$$R_{\theta JA} = \frac{(150^\circ C - T_A)}{P_D} \tag{eq. 2}$$

The value of R_{θJA} can then be compared with those in the package section of the data sheet. Those packages with R_{θJA}’s less than the calculated value in Equation 2 will keep the die temperature below 150°C. In some cases, none of the packages will be sufficient to dissipate the heat generated by the IC, and an external heat sink will be required. The current flow and voltages are shown in the Measurement Circuit Diagram.

Heat Sinks

A heat sink effectively increases the surface area of the package to improve the flow of heat away from the IC and into the surrounding air. Each material in the heat flow path between the IC and the outside environment will have a thermal resistance. Like series electrical resistances, these resistances are summed to determine the value of R_{θJA}:

$$R_{\theta JA} = R_{\theta JC} + R_{\theta CS} + R_{\theta SA} \tag{eq. 3}$$

Where:

R_{θJC} = the junction–to–case thermal resistance,

R_{θCS} = the case–to–heat sink thermal resistance, and

R_{θSA} = the heat sink–to–ambient thermal resistance.

R_{θJC} appears in the package section of the data sheet. Like R_{θJA}, it too is a function of package type. R_{θCS} and R_{θSA} are functions of the package type, heatsink and the interface between them. These values appear in data sheets of heatsink manufacturers.

Thermal, mounting, and heat sinking are discussed in the ON Semiconductor application note AN1040/D, available on the ON Semiconductor Website.
