## Dual Half-Bridge Driver with Parallel Input Control

The NCV7721 is a fully protected Dual Half-Bridge Driver designed specifically for automotive and industrial motion control applications. The two half-bridge drivers have independent control. This allows for high side, low side, and H-Bridge control. H-Bridge control provides forward, reverse, brake, and high impedance states (with EN = low).

The drivers are controlled via logic level inputs.

The device is available in a SOIC-14 package.

### Features

- 2 High-side and 2 Low-side Drivers Connected as Half-bridges
- 500 mA [typ], 1.1 A [max] Drivers
  - ♦  $R_{DS(on)} = 0.8 \Omega$  (typ),  $1.7 \Omega$  (max)
- Internal Free-wheeling Diodes
- Parallel Input Logic Control
- Ultra Low Quiescent Current in Sleep Mode,  $1 \mu A$  for  $V_S$  and  $V_{CC}$
- Compliance with 5 V and 3.3 V Systems
- Overvoltage and Undervoltage Lockout
- Fault Reporting for Underload, Overcurrent and Thermal Shutdown
- 3 A Current Limit
- Internally Fused Leads in SOIC-14 for Better Thermal Performance
- ESD Protection up to 6 kV
- This is a Pb-Free Device

### Applications

- Automotive
- Industrial
- DC Motor Management

DETAILED OPERATING DESCRIPTION

**General**

The NCV7721 Dual Half Bridge Driver provides drive capability for 2 Half-Bridge configurations. Each output drive is characterized for a 500 mA load with capability up to 1.1 A (min overvoltage shutdown threshold). Strict adherence to the integrated circuit die temperature is necessary, with a maximum die temperature of 150°C. Output drive control is handled via the parallel input control pins (IN1 & IN2). A single open Drain output reports underload, overload, and thermal shutdown faults.

An Enable function (EN) provides a low quiescent sleep current mode when the device is not being utilized. A resistor pulldown is provided on EN, IN1, and IN2 to insure a predictive state (low) in the event of a detached input signal.

**Power Up/Down Control (Undervoltage Detection)**

A feature incorporated in the NCV7721 is an undervoltage lockout circuit that prevents the output drivers from turning on unintentionally. VCC and V<sub>S</sub> are monitored for undervoltage conditions supporting a smooth turn-on transition. All drivers are initialized in the off (high impedance) condition, and will remain off during a VCC or V<sub>S</sub> undervoltage condition. This allows power up sequencing of VCC and V<sub>S</sub> up to the user. Hysteresis in the UVLO circuits results in glitch free operation during power up/down.

**Overvoltage Shutdown**

Overvoltage lockout monitors the voltage on the V<sub>S</sub> pin. When the overvoltage voltage threshold is breached (36.5 V [typ]), all outputs will turn off and remain off until V<sub>S</sub> is out of overvoltage. A typical voltage hysteresis of 2.5 V eliminates the possibility of oscillation at the shutdown threshold.

**H-Bridge Driver Configuration**

The NCV7721 has the flexibility of controlling each half bridge driver independently through the IN1 and IN2 logic input pins. This allows for high-side, low side and H-Bridge control. H-bridge control provides forward, reverse, brake and high impedance states.

**Overvoltage Clamping – Driving Inductive Loads**

Each output is internally clamped to ground and V<sub>S</sub> by internal freewheeling diodes. The diodes have ratings that complement the FETs they protect. A flyback event from

driving an inductive load causes the voltage on the output to rise up. Once the voltage rises higher than V<sub>S</sub> by a diode voltage (body diode of the high-side driver), the energy in the inductor will dissipate through the diode to V<sub>S</sub>. If a reverse battery diode is used in the system, care must be taken to insure the power supply capacitor is sufficient to dampen any increase in voltage to V<sub>S</sub> caused by the current flow through the body diode so that it is below 40 V. Negative transients will momentarily occur when a high-side driver driving an inductive load is turned off. This will be clamped by an internal diode from the output pin (OUT1 or OUT2) to the IC ground.

**Current Limit**

OUTx current is limited per the Current Limit electrical parameter for each driver. The magnitude of the current has a minimum specification of 2 A at VCC = 5 V and V<sub>S</sub> = 13.2 V. The output is protected for high power conditions during Current Limit by thermal shutdown and the Overcurrent Detection shutdown function. Overcurrent Detection shutdown protects the device during current limit because the Overcurrent threshold is below the Current Limit threshold. The Over current Detection Shutdown Control Timer is initiated at the Overcurrent Shutdown Threshold which starts before the Current Limit is reached.

Note: High currents will cause a rise in die temperature. Devices will not be allowed to turn on if the die temperature exceeds the thermal shutdown temperature.

**Overcurrent Shutdown**

Effected outputs will turn off when the Overcurrent Shutdown Threshold has been breached for the Overcurrent Shutdown Delay Time. FLT<sub>B</sub> will report a low and the driver will latch off. The driver can only be turned back on by a toggle of the EN pin or a power on reset of VCC.

**Overcurrent Detection Shut Down Timer**

There are two protection mechanisms for output current, overcurrent and current limit.

1. Current Limit – Maximum current for OUT1 and OUT2.
2. Overcurrent Detection – Threshold at which timer starts.

Figure 8 shows the typical performance of a part which has exceeded the 1.45 A (typ) Overcurrent Detection threshold and started the shutdown timer.

Figure 8. Output Current Shutdown Control

**Underload Detection**

The underload detection circuit monitors the current from each output driver. A minimum load current (this is the maximum open circuit detection threshold) is required when the drivers are turned on. If the underload detection threshold has been detected continuously for more than the underload delay time, FLTb will report a low. There is no change to the driver condition (remains in the active state). The fault can be cleared by a toggle of the EN pin or a power on reset of VCC.

The NCV7721 uses a global underload timer. An underload condition starts the global under load delay timer. If

under load occurs in another channel after the global timer has been started, the delay for any subsequent underload will be the remainder of the initially started timer. The timer runs continuously with any persistent under load condition and will impact the time for multi underload situations. Figures 9 and 10 highlight the timing conditions for an underload state where the global timer is reset (discontinuous time) and the conditions where the global timer is not reset (continuous time).

**Figure 9. Underload Discontinuous Time**

**Figure 10. Underload Continuous Time**

**ENABLE**

A single enable input (EN) provides on and off control for the two half-bridge outputs and activation of the fault reporting FLT pin. The EN input has a logic level input threshold. A high on EN enables both outputs (OUT1 & OUT2). The outputs will become active in the state which is represented by the respective input pins (IN1 & IN2).

**Input Control**

IN1 & IN2 are both logic level inputs which are active with EN high. A low on IN1 or IN2 with EN high activates the low-side drivers of OUT1 or OUT2. A high on IN1 or IN2 with EN high activates the high-side drivers of OUT1 or OUT2.

**Fault Reporting**

Fault reporting is carried out through the open-drain FLT pin. A pull-up resistor is required for operation. The FLT pin has a maximum voltage of 5.5 V. In normal operation, FLT reports a high signal. During a fault, the FLT pin will go low and stay low. FLT reporting is cleared by a toggle of the EN input or a power-on reset of VCC.

There are 3 faults reported by FLT

1. Underload
2. Overcurrent

**Table 5. FAULT TABLE**

Fault	FLT	Driver Condition During Fault	Driver Condition after Parameters Within Specified Limits	FLT Clear Requirement
No Fault	High	Output Driver on	Output Driver on	N/A
Underload (7 mA)	Low	unchanged	unchanged	EN toggle or VCC POR
Overcurrent	Low	Offending Driver is latched off after 25 $\mu$ s	Offending Driver is latched off	EN toggle or VCC POR
Thermal Shutdown	Low	All Drivers latched off at 175°C	All Drivers latched off	EN toggle or VCC POR

3. Thermal Shutdown

Undervoltage lockout and overvoltage lockout are **NOT** reported on FLT.

**Thermal Shutdown**

Thermal Shutdown uses one common sensor for each HS and LS transistor pair. If the IC temperature reaches Over Temperature Shutdown, all drivers are latched off and FLT will report a low. It can be reset only after the part cools below the shutdown temperature, including thermal hysteresis. The driver can be turned back on by a toggle of the EN pin or a power on reset of VCC.

**Table 4. LOGIC TABLE**

EN	IN1	IN2	OUT1	OUT2
0	0	0	Off	Off

**onsemi** and **ONSEMI** are trademarks of Semiconductor Components Industries, LLC dba **onsemi** or its subsidiaries in the United States and/or other countries. **onsemi** reserves the right to make changes without further notice to any products herein. **onsemi** makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does **onsemi** assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. **onsemi** does not convey any license under its patent rights nor the rights of others.

**onsemi**, **Onsemi**, and other names, marks, and brands are registered and/or common law trademarks of Semiconductor Components Industries, LLC dba "**onsemi**" or its affiliates and/or subsidiaries in the United States and/or other countries. **onsemi** owns the rights to a number of patents, trademarks, copyrights, trade secrets, and other intellectual property. A listing of **onsemi**'s product/patent coverage may be accessed at [www.onsemi.com/site/pdf/Patent-Marking.pdf](http://www.onsemi.com/site/pdf/Patent-Marking.pdf). **onsemi** reserves the right to make changes at any time to any products or information herein, without notice. The information herein is provided "as-is" and **onsemi** makes no warranty, representation or guarantee regarding the accuracy of the information, product features, availability, functionality, or suitability of its products for any particular purpose, nor does **onsemi** assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. Buyer is responsible for its products and applications using **onsemi** products, including compliance with all laws, regulations and safety requirements or standards, regardless of any support or applications information provided by **onsemi**. "Typical" parameters which may be provided in **onsemi** data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. **onsemi** does not convey any license under any of its intellectual property rights nor the rights of others. **onsemi** products are not designed, intended, or authorized for use as a critical component in life support systems or any FDA Class 3 medical devices or medical devices with a same or similar classification in a foreign jurisdiction or any devices intended for implantation in the human body. Should Buyer purchase or use **onsemi** products for any such unintended or unauthorized application, Buyer shall indemnify and hold **onsemi** and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that **onsemi** was negligent regarding the design or manufacture of the part. **onsemi** is an Equal Opportunity/Affirmative Action Employer. This literature is subject to all applicable copyright laws and is not for resale in any manner.
