Noise sensitive RF applications such as Power Amplifiers in satellite radios, infotainment equipment, and precision instrumentation require very clean power supplies. The NCV8752 is a 200 mA LDO that provides the engineer with a very stable, accurate voltage with ultra low noise and very high Power Supply Rejection Ratio (PSRR) suitable for RF applications. The device doesn’t require any additional noise bypass capacitor to achieve ultra low noise performance. In order to optimize performance for battery operated portable applications, the NCV8752 employs the Auto Low−Power Function for Ultra Low Quiescent Current consumption.

**Features**

- Operating Input Voltage Range: 2.0 V to 5.5 V
- Available in Fixed Voltage Options: 0.8 to 3.5 V
- Ultra Low Quiescent Current of Typ. 12 μA
- Ultra Low Noise: 11.5 μV_RMS_ from 100 Hz to 100 kHz
- Very Low Dropout: 130 mV Typical at 200 mA
- ±2% Accuracy Over Load/Line/Temperature
- High PSRR: 68 dB at 1 kHz
- Power Good Output
- Internal Soft−Start to Limit the Inrush Current
- Thermal Shutdown and Current Limit Protections
- Stable with a 1 μF Ceramic Output Capacitor
- Available in TSOP−5 and XDFN 1.5 x 1.5 mm Package
- Active Output Discharge for Fast Turn−Off
- NCV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC−Q100 Qualified and PPAP Capable
- These are Pb−Free Devices

**Typical Applications**

- Satellite Radio Receivers, GPS
- Rear View Camera, Electronic Mirrors, Lane Change Detectors
- Portable Entertainment Systems

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. Refer to ELECTRICAL CHARACTERISTICS and APPLICATION INFORMATION for Safe Operating Area.
2. This device series incorporates ESD protection and is tested by the following methods:
   - ESD Human Body Model tested per AEC-Q100-002 (EIA/JESD22-A114),
   - ESD Machine Model tested per AEC-Q100-003 (EIA/JESD22-A115),
   - Latchup Current Maximum Rating tested per JEDEC standard: JESD78.

4. Performance guaranteed over the indicated operating temperature range by design and/or characterization production tested at $T_J = T_A = 25^\circ\text{C}$. Low duty cycle pulse techniques are used during testing to maintain the junction temperature as close to ambient as possible.

5. Characterized when $V_{\text{OUT}}$ falls 100 mV below the regulated voltage at $V_{\text{IN}} = V_{\text{OUT(NOM)}} + 0.3\text{ V}$.

www.onsemi.com
The NCV8752 is a high performance, 200 mA LDO voltage regulator with open–drain PG flag. This device delivers excellent noise and dynamic performance. Thanks to its adaptive ground current feature the device consumes only 12 µA of quiescent current at no–load condition. The regulator features very–low noise of 11.5 µV_RMS, PSRR of typ. 68 dB at 1 kHz and very good load/line transient response. The device is an ideal choice for battery powered portable applications.

A logic EN input provides ON/OFF control of the output voltage. When the EN is low the device consumes as low as typ. 120 nA from the IN pin.

The device is fully protected in case of output overload, output short circuit condition and overheating, assuring a very robust design.

**Input Capacitor Selection (C_IN)**

It is recommended to connect a minimum of 1 µF Ceramic X5R or X7R capacitor close to the IN pin of the device. Larger input capacitors may be necessary if fast and large load transients are encountered in the application. There is no requirement for the min./max. ESR of the input capacitor but it is recommended to use ceramic capacitors for their low ESR and ESL.

**Output Capacitor Selection (C_OUT)**

The NCV8752 is designed to be stable with small 1.0 µF and larger ceramic capacitors on the output. The minimum effective output capacitance for which the LDO remains stable is 500 nF. The safety margin is provided to account for capacitance variations due to DC bias voltage, temperature, initial tolerance. There is no requirement for the minimum value of Equivalent Series Resistance (ESR) for the C_OUT but the maximum value of ESR should be less than 700 mΩ.

Larger output capacitors could be used to improve the load transient response or high frequency PSRR characteristics. It is not recommended to use tantalum capacitors on the output due to their large ESR. The equivalent series resistance of tantalum capacitors is also strongly dependent on the temperature, increasing at low temperature. The tantalum capacitors are generally more costly than ceramic capacitors.

**No–load Operation**

The regulator remains stable and regulates the output voltage properly within the ±2% tolerance limits even with no external load applied to the output.

**Enable Operation**

The NCV8752 uses the EN pin to enable/disable its output and to control the active discharge function. If the EN pin voltage is < 0.4 V the device is guaranteed to be disabled. The pass transistor is turned–off so that there is virtually no current flow between the IN and OUT. In case of the option equipped with active discharge – the active discharge transistor is turned–on and the output voltage V_OUT is pulled to GND through a 1 kΩ resistor. In the disable state the device consumes as low as typ. 120 nA from the V_IN. If the EN pin voltage > 0.9 V the device is guaranteed to be enabled. The NCV8752 regulates the output voltage and the active discharge transistor is turned–off. The EN pin has an internal pull–down current source with typ. value of 100 nA which assures that the device is turned–off when the EN pin is not connected. A build in deglitch time in the EN block prevents from periodic on/off oscillations that can occur due to noise on EN line. In the case that the EN function isn’t required the EN pin should be tied directly to IN.

**Reverse Current**

The PMOS pass transistor has an inherent body diode which will be forward biased in the case that V_OUT > V_IN. Due to this fact in cases where the extended reverse current condition is anticipated the device may require additional external protection.

**Output Current Limit**

Output Current is internally limited within the IC to a typical 400 mA. The NCV8752 will source this amount of current measured with the output voltage 100 mV lower than the nominal V_OUT. If the Output Voltage is directly shorted to ground (V_OUT = 0 V), the short circuit protection will limit the output current to 410 mA (typ). The current limit and short circuit protection will work properly up to V_IN = 5.5 V at \( T_A = 25°C \). There is no limitation for the short circuit duration.

**Thermal Shutdown**

When the die temperature exceeds the Thermal Shutdown threshold (TSD – 160°C typical), Thermal Shutdown event is detected and the device is disabled. The IC will remain in this state until the die temperature decreases below the Thermal Shutdown Reset threshold (TSDU – 140°C typical). Once the IC temperature falls below the 140°C the LDO is enabled again. The thermal shutdown feature provides protection from a catastrophic device failure due to accidental overheating. This protection is not intended to be used as a substitute for proper heat sinking.

**Power Dissipation**

As power dissipated in the LDO increases, it might become necessary to provide some thermal relief. The maximum power dissipation supported by the device is dependent upon board design and layout. Mounting pad configuration on the PCB, the board material, and the ambient temperature affect the rate of junction temperature rise for the part. The maximum power dissipation the NCV8752 can handle is given by:

\[
P_{D(MAX)} = \frac{[T_{J(MAX)} - T_A]}{\theta_{JA}}
\]

(eq. 1)
The power dissipated by the NCV8752 for given application conditions can be calculated as follows:

\[ P_{D\text{MAX}} = V_{\text{IN}}I_{\text{GND}} + I_{\text{OUT}}(V_{\text{IN}} - V_{\text{OUT}}) \]  

(eq. 2)

**Load Regulation**

The NCV8752 features very good load regulation of typical 4 mV in the 0 mA to 200 mA range. In order to achieve this very good load regulation a special attention to PCB design is necessary. The trace resistance from the OUT pin to the point of load can easily approach 100 mΩ which will cause a 20 mV voltage drop at full load current, deteriorating the excellent load regulation.

**Line Regulation**

The IC features very good line regulation of 0.3 mV/V measured from \( V_{\text{IN}} = V_{\text{OUT}} + 0.5 \) V to 5.5 V.

**Power Supply Rejection Ratio**

At low frequencies the PSRR is mainly determined by the feedback open-loop gain. At higher frequencies in the range 100 kHz – 10 MHz it can be tuned by the selection of \( C_{\text{OUT}} \) capacitor and proper PCB layout.

**Output Noise**

The IC is designed for very–low output voltage noise. The typical noise performance of 11.5 \( \mu \text{VRMS} \) makes the device suitable for noise sensitive applications.

**Internal Soft Start**

The Internal Soft–Start circuitry will limit the inrush current during the LDO turn–on phase. Please refer to typical characteristics section for typical inrush current values. The soft–start function prevents from any output voltage overshoots and assures monotonic ramp–up of the output voltage.

**PCB Layout Recommendations**

To obtain good transient performance and good regulation characteristics place \( C_{\text{IN}} \) and \( C_{\text{OUT}} \) capacitors close to the device pins and make the PCB traces wide. In order to minimize the solution size use 0402 capacitors. Larger copper area connected to the pins will also improve the device thermal resistance. The actual power dissipation can be calculated by the formula given in Equation 2.

PACKAGE DIMENSIONS

TSOP−5
CASE 483
ISSUE M

NOTES:
2. CONTROLLING DIMENSION: MILLIMETERS.
3. MAXIMUM LEAD THICKNESS INCLUDES LEAD FINISH THICKNESS. MINIMUM LEAD THICKNESS IS THE MINIMUM THICKNESS OF BASE MATERIAL.
4. DIMENSIONS A AND B DO NOT INCLUDE MOLD FLASH, PROTRUSIONS, OR GATE BURRS. MOLD FLASH, PROTRUSIONS, OR GATE BURRS SHALL NOT EXCEED 0.15 PER SIDE. DIMENSION A.
5. OPTIONAL CONSTRUCTION: AN ADDITIONAL TRIMMED LEAD IS ALLOWED IN THIS LOCATION. TRIMMED LEAD NOT TO EXTEND MORE THAN 0.2 FROM BODY.
