## Automotive 3-Phase 650 V 60 A Smart Power Module

### NFVA36065L42

#### General Description

NFVA36065L42 is an advanced Automotive SPM<sup>®</sup> module providing a fully-featured, high-performance inverter output stage for hybrid and electric vehicles. These modules integrate optimized gate drive of the built-in IGBTs to minimize EMI and losses, while also providing multiple on-module protection features including under-voltage lockouts, over-current shutdown, thermal monitoring of drive IC, and fault reporting. The built-in, high-speed HVIC requires only a single supply voltage and translates the incoming logic-level gate inputs to the high-voltage, high-current drive signals required to properly drive the module's internal IGBTs. Separate negative IGBT terminals are available for each phase to support the widest variety of control algorithms.

#### Features

- Automotive SPM in 27 Pin DIP Package
- AEC & AQG324 Qualified and PPAP Capable
- 650 V/60 A 3-Phase IGBT Inverter with Integral Gate Drivers and Protections
- 175°C Guaranteed Short-Circuit Rated FS Trench IGBTs with Low  $V_{ce(sat)}$  and Fast Switching
- Outstanding Thermal Resistance Using AIN DBC Substrate
- Separated Open-Emitter Pins from Low-Side IGBTs for Three-Phase Current Sensing
- Single-Grounded Power Supply
- LVIC Temperature-Sensing Built-In for Temperature Monitoring
- Isolation Rating: 2500  $V_{rms}/1$  min.
- Pb-Free and RoHS Compliant
- UI1557 Certified (File No. E209204) and UL94V-0 Compliant

#### Applications

- Automotive High Voltage Auxiliary Motors
  - ◆ Climate e-Compressors
  - ◆ Oil / Water Pumps
  - ◆ Super / Turbo Chargers
  - ◆ Variety Fans

#### ORDERING INFORMATION

See detailed ordering and shipping information on page 6 of this data sheet.

# NFVA36065L42

## Integrated Power Functions

- 650 V–60 A IGBT inverter for three–phase DC/AC power conversion (Refer to Figure 2)

## Integrated Drive, Protection and System Control Functions

- For inverter high–side IGBTs: gate drive circuit, high–voltage isolated high–speed level shifting control circuit, Under–Voltage Lock–Out Protection (UVLO)

- For inverter low–side IGBTs: gate drive circuit, Short–Circuit Protection (SCP) control supply circuit, Under–Voltage Lock–Out Protection (UVLO)
- Fault signaling: corresponding to UVLO (low–side supply) and SC faults
- Input interface: active–HIGH interface, works with 3.3/5 V logic, Schmitt–trigger input

## PIN DESCRIPTIONS

| Pin Number | Pin Name            | Pin Description                                           |
|------------|---------------------|-----------------------------------------------------------|
| 1          | V <sub>DD(L)</sub>  | Low-Side Common Bias Voltage for IC and IGBTs Driving     |
| 2          | COM                 | Common Supply Ground                                      |
| 3          | IN <sub>(UL)</sub>  | Signal Input for Low-Side U-Phase                         |
| 4          | IN <sub>(VL)</sub>  | Signal Input for Low-Side V-Phase                         |
| 5          | IN <sub>(WL)</sub>  | Signal Input for Low-Side W-Phase                         |
| 6          | V <sub>FO</sub>     | Fault Output                                              |
| 7          | V <sub>TS</sub>     | Output for LVIC Temperature Sensing Voltage Output        |
| 8          | C <sub>SC</sub>     | Shut Down Input for Short-Circuit Current Detection Input |
| 9          | IN <sub>(UH)</sub>  | Signal Input for High-Side U-Phase                        |
| 10         | V <sub>DD(UH)</sub> | High-Side Common Bias Voltage for IC and IGBTs Driving    |
| 11         | V <sub>B(U)</sub>   | High-Side Bias Voltage for U-Phase IGBT Driving           |
| 12         | V <sub>S(U)</sub>   | High-Side Bias Voltage Ground for U-Phase IGBT Driving    |
| 13         | IN <sub>(VH)</sub>  | Signal Input for High-Side V-Phase                        |
| 14         | V <sub>DD(VH)</sub> | High-Side Common Bias Voltage for IC and IGBTs Driving    |
| 15         | V <sub>B(V)</sub>   | High-Side Bias Voltage for V-Phase IGBT Driving           |
| 16         | V <sub>S(V)</sub>   | High-Side Bias Voltage Ground for V-Phase IGBT Driving    |
| 17         | IN <sub>(WH)</sub>  | Signal Input for High-Side W-Phase                        |
| 18         | V <sub>DD(WH)</sub> | High-Side Common Bias Voltage for IC and IGBTs Driving    |
| 19         | V <sub>B(W)</sub>   | High-Side Bias Voltage for W-Phase IGBT Driving           |
| 20         | V <sub>S(W)</sub>   | High-Side Bias Voltage Ground for W-Phase IGBT Driving    |
| 21         | N <sub>U</sub>      | Negative DC-Link Input for U-Phase                        |
| 22         | N <sub>V</sub>      | Negative DC-Link Input for V-Phase                        |
| 23         | N <sub>W</sub>      | Negative DC-Link Input for W-Phase                        |
| 24         | U                   | Output for U-Phase                                        |
| 25         | V                   | Output for V-Phase                                        |
| 26         | W                   | Output for W-Phase                                        |
| 27         | P                   | Positive DC-Link Input                                    |

INTERNAL EQUIVALENT CIRCUIT AND INPUT/OUTPUT PINS

NOTES:

1. Inverter low-side is composed of three IGBTs, freewheeling diodes for each IGBT, and one control IC. It has gate drive and protection functions.
2. Inverter power side is composed of four inverter DC-link input terminals and three inverter output terminals.
3. Inverter high-side is composed of three IGBTs, freewheeling diodes, and three drive ICs for each IGBT.

Figure 2. Internal Block Diagram

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

7.  $t_{ON}$  and  $t_{OFF}$  include the propagation delay time of the internal drive IC.  $t_{C(ON)}$  and  $t_{C(OFF)}$  are the switching time of IGBT itself under the given gate driving condition internally. For the detailed information, please see Figure 3.

Figure 3. Switching Time Definition

The diagram illustrates the internal circuitry of a power MOSFET driver, labeled "One-Leg Diagram". It shows two MOSFETs (N-channel and P-channel) with their respective gates, sources, and drains. The gates are connected to a driver circuit that includes a 4.7 kΩ resistor and a 15V supply. The sources are connected to ground. The drains are connected to the power MOSFETs, which are in turn connected to a load (inductor) and a 300V supply. The diagram also shows the internal components of the driver, including the MOSFETs, gate driver, and power MOSFETs. The input is a 5V signal, and the output is a 300V signal. The diagram is labeled "One-Leg Diagram" and shows the internal components like VDD, VBS, COM, IN, OUT, and VFS.

Figure 10 consists of two line graphs comparing switching losses ( $E_{sw}$ ) in  $\mu J$  versus collector current ( $I_c$ ) in Amperes for an inductive load with  $V_{PN} = 300V$ ,  $V_{DO} = 15V$ , and  $T_j = 25^\circ C$  (left) and  $T_j = 150^\circ C$  (right). The y-axis ranges from 0 to 4000  $\mu J$ , and the x-axis ranges from 0 to 60 Amperes. The legend for both graphs is: IGBT Turn-on,  $E_{on}$  (red line), IGBT Turn-off,  $E_{off}$  (blue line), and FRD Trun-off,  $E_{rec}$  (green line). In both graphs,  $E_{on}$  and  $E_{off}$  increase with  $I_c$ , while  $E_{rec}$  remains relatively constant. At  $150^\circ C$ , the switching losses are significantly higher than at  $25^\circ C$ .

| V <sub>IN(ON)</sub>  | ON Threshold Voltage                       | Applied between I <sub>N(UH,VH,WH)</sub> – COM<br>I <sub>N(UL,VL,WL)</sub> – COM                                                        | –                                                                                                                             | –    | 2.6  | V       |
| V <sub>IN(OFF)</sub> | OFF Threshold Voltage                      |                                                                                                                                         | 0.8                                                                                                                           | –    | –    | V       |

8. Short-circuit current protection is functioning only at the low-sides.

9. T<sub>LVIC</sub> is the temperature of LVIC itself. V<sub>TS</sub> is only for sensing temperature of LVIC and can not shutdown IGBTs automatically.

## RECOMMENDED OPERATING CONDITIONS

| PW <sub>IN(OFF)</sub> |                           |                                                                                                                                                       | 2.5 | – | –   |    |
| T <sub>J</sub>        | Junction Temperature      |                                                                                                                                                       | –40 | – | 150 | °C |

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

10. This product might not make response if input pulse width is less than the recommended value.

**MECHANICAL CHARACTERISTICS AND RATINGS**

**Figure 7. Flatness Measurement Position**

**NOTES:**

11. Do not make over torque when mounting screws. Much mounting torque may cause DBC cracks, as well as bolts and Al heat-sink destruction
12. Avoid one-sided tightening stress. Figure 9 shows the recommended torque order for mounting screws. Uneven mounting can cause the DBC substrate of package to be damaged. The pre-screwing torque is set to 20 ~ 30% of maximum torque rating.

**Figure 8. Mounting Screws Torque Order**

## NFVA36065L42

- a1: Control supply voltage rises: After the voltage rises  $UV_{DDR}$ , the circuits start to operate when next input is applied.
- a2: Normal operation: IGBT ON and carrying current.
- a3: Under voltage detection ( $UV_{DDD}$ ).
- a4: IGBT OFF in spite of control input condition.
- a5: Fault output operation starts with a fixed pulse width.
- a6: Under voltage reset ( $UV_{DDR}$ ).
- a7: Normal operation: IGBT ON and carrying current by triggering next signal from LOW to HIGH.

**Figure 9. Under-Voltage Protection (Low-Side)**

- b1: Control supply voltage rises: After the voltage rises  $UV_{BSR}$ , the circuits start to operate when next input is applied.
- b2: Normal operation: IGBT ON and carrying current.
- b3: Under voltage detection ( $UV_{BSD}$ ).
- b4: IGBT OFF in spite of control input condition, but there is no fault output signal.
- b5: Under voltage reset ( $UV_{BSR}$ ).
- b6: Normal operation: IGBT ON and carrying current by triggering next signal from LOW to HIGH.

**Figure 10. Under-Voltage Protection (High-Side)**

(with the external sense resistance and RC filter connection)

c1: Normal operation: IGBT ON and carrying current.

c2: Short circuit current detection (SC trigger).

c3: All low-side IGBT's gate are hard interrupted.

c4: All low-side IGBTs turn OFF.

c5: Fault output operation starts with a fixed pulse width.

c6: Input HIGH: IGBT ON state, but during the active period of fault output the IGBT doesn't turn ON.

c7: Fault output operation finishes, but IGBT doesn't turn on until triggering next signal from LOW to HIGH.

c8: Normal operation: IGBT ON and carrying current.

**Figure 11. Short-Circuit Current Protection (Low-Side Operation Only)**

NOTE:

13. RC coupling at each input might change depending on the PWM control scheme used in the application and the wiring impedance of the application's printed circuit board. The input signal section of the Motion SPM 3 product integrates 5kΩ (typ.) pull-down resistor. Therefore, when using an external filtering resistor, please pay attention to the signal voltage drop at input terminal.

**Figure 12. Recommended CPU I/O Interface Circuit**

NOTES:

14. To avoid malfunction, the wiring of each input should be as short as possible. (less than 2–3 cm)
15.  $V_{FO}$  output is open-drain type. The signal line should be pulled up to the positive side of the MCU or control power supply with a resistor that makes  $I_{FO}$  up to 2mA. Refer to Figure 12.
16. Input signal is active-HIGH type. There is a 5 k $\Omega$  resistor inside the IC to pull-down each input signal line to GND. RC coupling circuits should be adopted for the prevention of input signal oscillation.  $R_1C_1$  time constant should be selected in the range 50–150 ns. (Recommended  $R_1 = 100 \Omega$ ,  $C_1 = 1 \text{ nF}$ )
17. Each wiring pattern inductance of A point should be minimized (Recommended less than 10 nH). Use the shunt resistor  $R_4$  of surface mounted (SMD) type to reduce wiring inductance. To prevent malfunction, wiring of point E should be connected to the terminal of the shunt resistor  $R_4$  as close as possible.
18. To prevent errors of the protection function, the wiring of B, C and D point should be as short as possible.
19. In the short-circuit protection circuit, please select the  $R_6C_6$  time constant in the range 1.5–2  $\mu\text{s}$ . Do enough evaluation on the real system because short-circuit protection time may vary wiring pattern layout and value of the  $R_6C_6$  time constant.
20. Each capacitor should be mounted as close to the pins of the ASPM27 product as possible.
21. To prevent surge destruction, the wiring between the smoothing capacitor  $C_7$  and the P & GND pins should be as short as possible. The use of a high-frequency non-inductive capacitor of around 0.1–0.22  $\mu\text{F}$  between the P & GND pins is recommended.
22. Relays are used at almost every systems of electrical equipment at industrial application. In these cases, there should be sufficient distance between the CPU and the relays.
23. The zener diode or transient voltage suppressor should be adopted for the protection of ICs from the surge destruction between each pair of control supply terminals (Recommended zener diode is 22 V/1 W. which has the lower zener impedance characteristic than about 15  $\Omega$ ).
24.  $C_2$  of around 7 times larger than bootstrap capacitor  $C_3$  is recommended.
25. Choose the electrolytic capacitor with good temperature characteristic in  $C_3$ . Also choose 0.1–0.2  $\mu\text{F}$  R-category ceramic capacitors with good temperature and frequency characteristics in  $C_4$ .
