

# EEPROM Serial 32-Kb SPI Automotive Grade 1 in Wettable Flank UDFN-8 Package

## NV25320MUW

### Description

The NV25320MUW is a EEPROM Serial 32-Kb SPI Automotive Grade 1 device internally organized as 4096x8 bits. This features a 32-byte page write buffer and supports the Serial Peripheral Interface (SPI) protocol. The device is enabled through a Chip Select ( $\overline{CS}$ ) input. In addition, the required bus signals are clock input (SCK), data input (SI) and data output (SO) lines. The  $\overline{HOLD}$  input may be used to pause any serial communication with the NV25320MUW device. The device features software and hardware write protection, including partial as well as full array protection.

### Features

- Automotive AEC-Q100 Grade 1 (–40°C to +125°C) Qualified
- 10 MHz SPI Compatible
- 2.5 V to 5.5 V Supply Voltage Range
- SPI Modes (0,0) & (1,1)
- 32-byte Page Write Buffer
- Self-timed Write Cycle
- Hardware and Software Protection
- Block Write Protection
  - Protect 1/4, 1/2 or Entire EEPROM Array
- Low Power CMOS Technology
- 1,000,000 Program/Erase Cycles
- 100 Year Data Retention
- Wettable Flank UDFN 8-pad Package
- This Device is Pb-Free, Halogen Free/BFR Free, and RoHS Compliant

### PIN CONFIGURATIONS

### PIN FUNCTION

| Pin Name          | Function                |
|-------------------|-------------------------|
| $\overline{CS}$   | Chip Select             |
| SO                | Serial Data Output      |
| $\overline{WP}$   | Write Protect           |
| VSS               | Ground                  |
| SI                | Serial Data Input       |
| SCK               | Serial Clock            |
| $\overline{HOLD}$ | Hold Transmission Input |
| VCC               | Power Supply            |

### ORDERING INFORMATION

See detailed ordering and shipping information on page 10 of this data sheet.

## DEVICE MARKING

(UDFN8)

S5W = Specific Device Code

A = Assembly Location

WL = Wafer Lot Number

YW = Assembly Start Week

■ = Pb-Free Package

(Note: Microdot may be in either location)

**Table 1. ABSOLUTE MAXIMUM RATINGS**

| Parameters   | Ratings      | Unit |
|--|--------------|------|
| Operating Temperature                              | -45 to +130  | °C   |
| Storage Temperature                                | -65 to +150  | °C   |
| Voltage on any Pin with Respect to Ground (Note 1) | -0.5 to +6.5 | V    |

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. The DC input voltage on any pin should not be lower than -0.5 V or higher than  $V_{CC} + 0.5$  V. During transitions, the voltage on any pin may undershoot to no less than -1.5 V or overshoot to no more than  $V_{CC} + 1.5$  V, for periods of less than 20 ns.

**Table 2. RELIABILITY CHARACTERISTICS** (Note 2)

| Symbol             | Parameter      | Min       | Unit                   |
|--------------------|----------------|-----------|------------------------|
| $N_{END}$ (Note 3) | Endurance      | 1,000,000 | Program / Erase Cycles |
| $T_{DR}$           | Data Retention | 100       | Years                  |

2. These parameters are tested initially and after a design or process change that affects the parameter according to appropriate AEC-Q100 and JEDEC test methods.
3. Page Mode,  $V_{CC} = 5$  V, 25°C.

**Table 3. DC OPERATING CHARACTERISTICS** ( $V_{CC} = 2.5$  V to 5.5 V,  $T_A = -40$ °C to +125°C, unless otherwise specified.)

| Symbol    | Parameter                   | Test Conditions  | Min              | Max            | Unit |
|-----------|-----------------------------|--|------------------|----------------|------|
| $I_{CCR}$ | Supply Current (Read Mode)  | Read, $V_{CC} = 5.5$ V, 10 MHz, SO open  |                  | 2              | mA   |
| $I_{CCW}$ | Supply Current (Write Mode) | Write, $V_{CC} = 5.5$ V, $\overline{CS} = V_{CC}$  |                  | 3              | mA   |
| $I_{SB1}$ | Standby Current             | $V_{IN} = GND$ or $V_{CC}$ , $\overline{CS} = V_{CC}$ ,<br>$\overline{WP} = V_{CC}$ , $V_{CC} = 5.5$ V |                  | 4              | μA   |
| $I_{SB2}$ | Standby Current             | $V_{IN} = GND$ or $V_{CC}$ , $\overline{CS} = V_{CC}$ ,<br>$\overline{WP} = GND$ , $V_{CC} = 5.5$ V    |                  | 6              | μA   |
| $I_L$     | Input Leakage Current       | $V_{IN} = GND$ or $V_{CC}$   | -2               | 2              | μA   |
| $I_{LO}$  | Output Leakage Current      | $\overline{CS} = V_{CC}$ ,<br>$V_{OUT} = GND$ or $V_{CC}$  | -1               | 2              | μA   |
| $V_{IL}$  | Input Low Voltage           |  | -0.5             | $0.3 V_{CC}$   | V    |

| $t_{\text{CNH}}$         | $\overline{\text{CS}}$ Inactive Hold Time  | 20                                     |     | ns            |
| $t_{\text{WPS}}$         | $\overline{\text{WP}}$ Setup Time          | 10                                     |     | ns            |
| $t_{\text{WPH}}$         | $\overline{\text{WP}}$ Hold Time           | 10                                     |     | ns            |
| $t_{\text{WC}}$ (Note 6) | Write Cycle Time                           |  | 5   | ms            |

4. AC Test Conditions:

Input Pulse Voltages:  $0.3 V_{CC}$  to  $0.7 V_{CC}$

Input rise and fall times:  $\leq 10\text{ ns}$

Input and output reference voltages:  $0.5 V_{CC}$

Output load: current source  $I_{OL\text{ max}}/I_{OH\text{ max}}$ ;  $C_L = 30\text{ pF}$

5. This parameter is tested initially and after a design or process change that affects the parameter.

6.  $t_{\text{WC}}$  is the time from the rising edge of  $\overline{\text{CS}}$  after a valid write sequence to the end of the internal write cycle.

**Table 6. POWER-UP TIMING** (Note 7)

| Symbol           | Parameter                   | Max | Unit |
|------------------|-----------------------------|-----|------|
| $t_{\text{PUR}}$ | Power-up to Read Operation  | 1   | ms   |
| $t_{\text{PUW}}$ | Power-up to Write Operation | 1   | ms   |

7.  $t_{\text{PUR}}$  and  $t_{\text{PUW}}$  are the delays required from the time  $V_{CC}$  is stable until the specified operation can be initiated.

### Pin Description

**SI:** The serial data input pin accepts op-codes, addresses and data. In SPI modes (0,0) and (1,1) input data is latched on the rising edge of the SCK clock input.

**SO:** The serial data output pin is used to transfer data out of the device. In SPI modes (0,0) and (1,1) data is shifted out on the falling edge of the SCK clock.

**SCK:** The serial clock input pin accepts the clock provided by the host and used for synchronizing communication between host and NV25320MUW.

**$\overline{\text{CS}}$ :** The chip select input pin is used to enable/disable the NV25320MUW. When  $\overline{\text{CS}}$  is high, the SO output is tri-stated (high impedance) and the device is in Standby Mode (unless an internal write operation is in progress). *Every communication session between host and NV25320MUW must be preceded by a high to low transition and concluded with a low to high transition of the  $\overline{\text{CS}}$  input.*

**$\overline{\text{WP}}$ :** The write protect input pin will allow all write operations to the device when held high. When  $\overline{\text{WP}}$  pin is tied low and the WPEN bit in the Status Register (refer to Status Register description, later in this Data Sheet) is set to "1", writing to the Status Register is disabled.

**$\overline{\text{HOLD}}$ :** The  $\overline{\text{HOLD}}$  input pin is used to pause transmission between host and NV25320MUW, without having to retransmit the entire sequence at a later time. To pause,  $\overline{\text{HOLD}}$  must be taken low and to resume it must be taken back high, with the SCK input low during both transitions. When not used for pausing, the  $\overline{\text{HOLD}}$  input should be tied to  $V_{\text{CC}}$ , either directly or through a resistor.

### Functional Description

The NV25320MUW device supports the Serial Peripheral Interface (SPI) bus protocol, modes (0,0) and (1,1). The device contains an 8-bit instruction register. The instruction set and associated op-codes are listed in Table 7.

Reading data stored in the NV25320MUW is accomplished by simply providing the READ command and an address. Writing to the NV25320MUW, in addition to a WRITE command, address and data, also requires enabling the device for writing by first setting certain bits in a Status Register, as will be explained later.

After a high to low transition on the  $\overline{\text{CS}}$  input pin, the NV25320MUW will accept any one of the six instruction op-codes listed in Table 7 and will ignore all other possible 8-bit combinations. The communication protocol follows the timing from Figure 2.

Table 7. INSTRUCTION SET

| Instruction | Opcode    | Operation                |
|-------------|-----------|--------------------------|
| WREN        | 0000 0110 | Enable Write Operations  |
| WRDI        | 0000 0100 | Disable Write Operations |
| RDSR        | 0000 0101 | Read Status Register     |
| WRSR        | 0000 0001 | Write Status Register    |
| READ        | 0000 0011 | Read Data from Memory    |
| WRITE       | 0000 0010 | Write Data to Memory     |

Figure 2. Synchronous Data Timing

## Status Register

The Status Register, as shown in Table 8, contains a number of status and control bits.

The  $\overline{\text{RDY}}$  (Ready) bit indicates whether the device is busy with a write operation. This bit is automatically set to 1 during an internal write cycle, and reset to 0 when the device is ready to accept commands. For the host, this bit is read only.

The WEL (Write Enable Latch) bit is set/reset by the WREN/WRDI commands. When set to 1, the device is in a Write Enable state and when set to 0, the device is in a Write Disable state.

The BP0 and BP1 (Block Protect) bits determine which blocks are currently write protected. They are set by the user with the WRSR command and are non-volatile. The user is

allowed to protect a quarter, one half or the entire memory, by setting these bits according to Table 9. The protected blocks then become read-only.

The WPEN (Write Protect Enable) bit acts as an enable for the  $\overline{\text{WP}}$  pin. Hardware write protection is enabled when the  $\overline{\text{WP}}$  pin is low and the WPEN bit is 1. This condition prevents writing to the status register and to the block protected sections of memory. While hardware write protection is active, only the non-block protected memory can be written. Hardware write protection is disabled when the  $\overline{\text{WP}}$  pin is high or the WPEN bit is 0. The WPEN bit,  $\overline{\text{WP}}$  pin and WEL bit combine to either permit or inhibit Write operations, as detailed in Table 10.

**Table 8. STATUS REGISTER**

|      |   |   |   |     |     |     |     |
|------|---|---|---|-----|-----|-----|-----|
| 7    | 6 | 5 | 4 | 3   | 2   | 1   | 0   |
| WPEN | 0 | 0 | 0 | BP1 | BP0 | WEL | RDY |

**Table 9. BLOCK PROTECTION BITS**

| Status Register Bits |     | Array Address Protected | Protection               |
|----------------------|-----|-------------------------|--------------------------|
| BP1                  | BP0 |                         |                          |
| 0                    | 0   | None                    | No Protection            |
| 0                    | 1   | 0C00–0FFF               | Quarter Array Protection |
| 1                    | 0   | 0800–0FFF               | Half Array Protection    |
| 1                    | 1   | 0000–0FFF               | Full Array Protection    |

**Table 10. WRITE PROTECT CONDITIONS**

| WPEN | $\overline{\text{WP}}$ | WEL | Protected Blocks | Unprotected Blocks | Status Register |
|------|------------------------|-----|------------------|--------------------|-----------------|
| 0    | X                      | 0   | Protected        | Protected          | Protected       |
| 0    | X                      | 1   | Protected        | Writable           | Writable        |
| 1    | Low                    | 0   | Protected        | Protected          | Protected       |
| 1    | Low                    | 1   | Protected        | Writable           | Protected       |
| X    | High                   | 0   | Protected        | Protected          | Protected       |
| X    | High                   | 1   | Protected        | Writable           | Writable        |

## WRITE OPERATIONS

The NV25320MUW device powers up into a write disable state. The device contains a Write Enable Latch (WEL) which must be set before attempting to write to the memory array or to the status register. In addition, the address of the memory location(s) to be written must be outside the protected area, as defined by BP0 and BP1 bits from the status register.

### Write Enable and Write Disable

The internal Write Enable Latch and the corresponding Status Register WEL bit are set by sending the WREN instruction to the NV25320MUW. Care must be taken to take the  $\overline{CS}$  input high after the WREN instruction, as otherwise the Write Enable Latch will not be properly set. WREN timing is illustrated in Figure 3. The WREN instruction must be sent prior to any WRITE or WRSR instruction.

The internal write enable latch is reset by sending the WRDI instruction as shown in Figure 4. Disabling write operations by resetting the WEL bit, will protect the device against inadvertent writes.

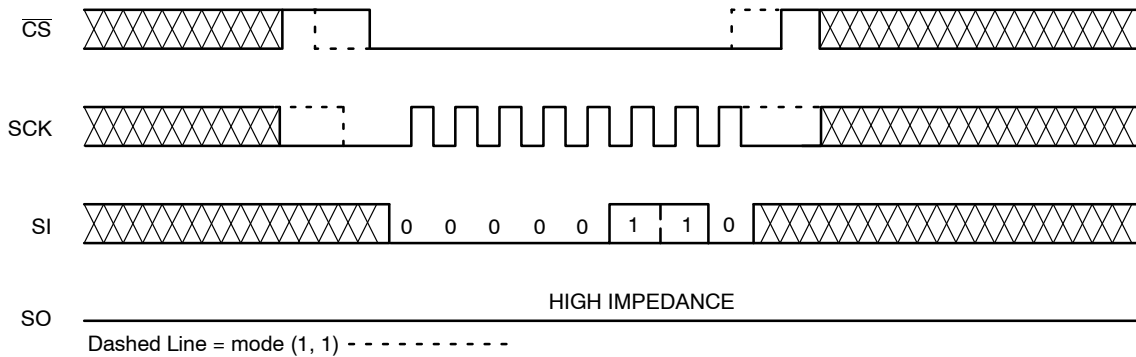

Figure 3. WREN Timing

Figure 4. WRDI Timing

# NV25320MUW

## Byte Write

Once the WEL bit is set, the user may execute a write sequence, by sending a WRITE instruction, a 16-bit address and data as shown in Figure 5. Only 12 significant address bits are used by the NV25320MUW. The rest are don't care bits, as shown in Table 11. Internal programming will start after the low to high  $\overline{CS}$  transition. During an internal write cycle, all commands, except for RDSR (Read Status Register) will be ignored. The  $\overline{RDY}$  bit will indicate if the internal write cycle is in progress ( $\overline{RDY}$  high), or the device is ready to accept commands ( $\overline{RDY}$  low).

## Page Write

After sending the first data byte to the NV25320MUW, the host may continue sending data, up to a total of 32 bytes, according to timing shown in Figure 6. After each data byte, the lower order address bits are automatically incremented, while the higher order address bits (page address) remain unchanged. If during this process the end of page is exceeded, then loading will "roll over" to the first byte in the page, thus possibly overwriting previously loaded data. Following completion of the write cycle, the NV25320MUW is automatically returned to the write disable state.

**Table 11. BYTE ADDRESS**

| Device     | Address Significant Bits | Address Don't Care Bits | # Address Clock Pulses |
|------------|--------------------------|-------------------------|------------------------|
| NV25320MUW | A11 – A0                 | A15 – A12               | 16                     |

**Figure 5. Byte WRITE Timing**

**Figure 6. Page WRITE Timing**

### Write Status Register

The Status Register is written by sending a WRSR instruction according to timing shown in Figure 7. Only bits 2, 3 and 7 can be written using the WRSR command.

### Write Protection

The Write Protect ( $\overline{WP}$ ) pin can be used to protect the Block Protect bits BP0 and BP1 against being inadvertently altered. When  $\overline{WP}$  is low and the WPEN bit is set to “1”, write operations to the Status Register are inhibited.  $\overline{WP}$  going low while  $\overline{CS}$  is still low will interrupt a write to the status register. If the internal write cycle has already been initiated,  $\overline{WP}$  going low will have no effect on any write operation to the Status Register. The  $\overline{WP}$  pin function is blocked when the WPEN bit is set to “0”. The  $\overline{WP}$  input timing is shown in Figure 8.

Figure 8. WP Timing

## READ OPERATIONS

### Read from Memory Array

To read from memory, the host sends a READ instruction followed by a 16-bit address (see Table 11 for the number of significant address bits).

After receiving the last address bit, the NV25320MUW will respond by shifting out data on the SO pin (as shown in Figure 9). Sequentially stored data can be read out by simply continuing to run the clock. The internal address pointer is automatically incremented to the next higher address as data is shifted out. After reaching the highest memory address, the address counter “rolls over” to the lowest memory address, and the read cycle can be continued indefinitely. The read operation is terminated by taking  $\overline{CS}$  high.

### Read Status Register

To read the status register, the host simply sends a RDSR command. After receiving the last bit of the command, the CAT25320 will shift out the contents of the status register on the SO pin (Figure 10). The status register may be read at any time, including during an internal write cycle. While the internal write cycle is in progress, the RDSR command will output the full content of the status register. For easy detection of the internal write cycle completion, both during writing to the memory array and to the status register, we recommend sampling the  $\overline{RDY}$  bit only through the polling routine. After detecting the  $\overline{RDY}$  bit “0”, the next RDSR instruction will always output the expected content of the status register.

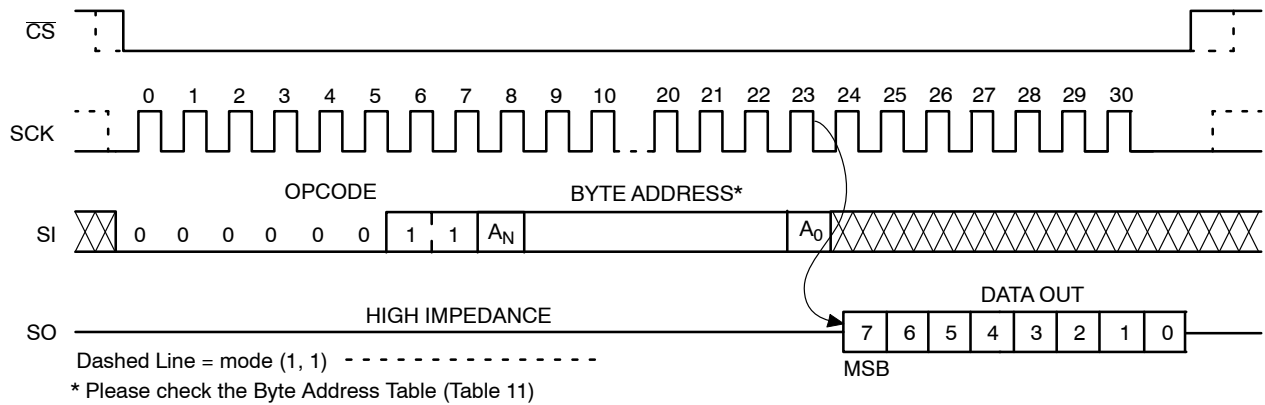

Figure 9. READ Timing

Figure 10. RDSR Timing

### Hold Operation

The  $\overline{\text{HOLD}}$  input can be used to pause communication between host and NV25320MUW. To pause,  $\overline{\text{HOLD}}$  must be taken low while SCK is low (Figure 11). During the hold condition the device must remain selected ( $\overline{\text{CS}}$  low). During the pause, the data output pin (SO) is tri-stated (high impedance) and SI transitions are ignored. To resume communication,  $\overline{\text{HOLD}}$  must be taken high while SCK is low.

### Design Considerations

The NV25320MUW device incorporates Power-On Reset (POR) circuitry which protects the internal logic against powering up in the wrong state. The device will power up into Standby mode after  $V_{CC}$  exceeds the POR trigger level and will power down into Reset mode when

$V_{CC}$  drops below the POR trigger level. This bi-directional POR behavior protects the device against ‘brown-out’ failure following a temporary loss of power.

The NV25320MUW device powers up in a write disable state and in a low power standby mode. A WREN instruction must be issued prior to any writes to the device.

After power up, the  $\overline{\text{CS}}$  pin must be brought low to enter a ready state and receive an instruction. After a successful byte/page write or status register write, the device goes into a write disable mode. The  $\overline{\text{CS}}$  input must be set high after the proper number of clock cycles to start the internal write cycle. Access to the memory array during an internal write cycle is ignored and programming is continued. Any invalid op-code will be ignored and the serial output pin (SO) will remain in the high impedance state.

### ORDERING INFORMATION (Notes 8 – 10)

| Device Order Number | Specific Device Marking | Package Type                           | Shipping†          |
|---------------------|-------------------------|--|--------------------|
| NV25640MUW3VTBG     | S5W                     | UDFN8<br>(Wettable Flank<br>(Pb-Free)) | 3000 / Tape & Reel |

†For information on tape and reel specifications, including part orientation and tape sizes, please refer to our Tape and Reel Packaging Specifications Brochure, BRD8011/D.

8. All packages are RoHS-compliant (Pb-Free, Halogen-free).

9. The standard lead finish is NiPdAu.

10. For additional package and temperature options, please contact your nearest ON Semiconductor Sales office.

SCALE 2:1

**UDFN8 2x3, 0.5P**  
CASE 517DH  
ISSUE A

DATE 10 DEC 2020

**NOTES:**

1. DIMENSIONING AND TOLERANCING PER ASME Y14.5M,1994.
2. CONTROLLING DIMENSION: MILLIMETERS
3. DIMENSION b APPLIES TO PLATED TERMINAL AND IS MEASURED BETWEEN 0.15 AND 0.25MM FROM THE TERMINAL TIP.
4. COPLANARITY APPLIES TO THE EXPOSED PAD AS WELL AS THE TERMINALS.

| DIM | MILLIMETERS |      |      |
|-----|-------------|------|------|
|     | MIN.        | NDM. | MAX. |
| A   | 0.45        | 0.50 | 0.55 |
